Tim Berners Lee <u>at the Net Mundial conference</u> in Brazil, 2014 (emphasis added):

"The web needs to remain a system which exists without regard to national borders. Today most of the work is already done in the non-national Internet technical community. I was also pleased to hear that ICANN is beginning a dialogue to create a multi-stakeholder review process to replace that of the U.S. government. That is appropriate because ICANN services the global public interest.

"For me, that means that when a decision is taken about a possible new toplevel domain, ICANN's job is to work out, in a transparent and accountable manner, whether it is really in the best interest of the world as a whole, not just of those launching the new domain."

ICANN has failed in its new gTLDs domain name program to heed the wise words of Sir Tim. As a result, until 4.2.1 of your <u>Preliminary Report</u> is answered, all other issues should be deferred as they are premature.

Should there even be gTLDs? Most of the <u>original gTLDs</u> (EDU, COM, NET, ORG, GOV, MIL, and INT), were, and many still are, operating under the authority of the U.S. government. Why should lawless <u>multinational corporations</u> be allowed "brand" gTLDs.

Many fundamental questions were left unanswered in the original policy development process and implementation, see: <u>ICANN Insiders On New gTLDs: Mistakes, Fiascos,</u> <u>Horrible Implementation</u>

Respectfully submitted,

John Poole, Editor, DomainMondo.com
