Draft Initial Report of the GNSO Fast Flux Hosting Working Group

STATUS OF THIS DOCUMENT

This is the Initial Report of the Working Group on fast flux hosting, for submission to the GNSO Council on [TBC]. A Final Report will be prepared following public comment.

SUMMARY

This report is submitted to the GNSO Council and posted for public comment as a required step in this GNSO Policy Development Process on Fast Flux Hosting.

43

44 **1 Executive summary**

45

46 **TBD...**

47

47

48 **2 Report Process and Next Steps**

49 This Initial Report on fast flux is prepared as required by the GNSO Policy Development
50 Process as stated in the ICANN Bylaws, Annex A (see
51 <http://www.icann.org/general/bylaws.htm#AnnexA>). The Initial Report will be posted for
52 public comment for 20 days. The comments received will be analyzed and used for
53 redrafting of the Initial Report into a Final Report to be considered by the GNSO Council for
54 further action.

55

56

57

57

58 **3 Background**

59 **3.1 Process background**

60

61 **3.1.1 Security and Stability Advisory Committee**

62

63 The ICANN Security and Stability Advisory Committee (SSAC) completed a study of the way
64 in which the DNS can be manipulated by Internet cyber-criminals to evade detection and
65 termination of their illegal activities. The results of the study were published in January 2008
66 in the SSAC Advisory on Fast Flux Hosting and DNS (SAC 025)¹, which describes the
67 techniques that are collectively referred to as “fast flux hosting,” explains how these
68 techniques enable cybercriminals to extend the maliciously useful lifetime of compromised
69 hosts employed in illegal activities, and “encourages ICANN, registries, and registrars...to
70 establish best practices to mitigate fast flux hosting, and to consider whether such practices
71 should be addressed in future [accreditation] agreements.”²

72

73 During its teleconference meeting on 6 March 2008,³ the GNSO Council entertained the
74 following motion, which carried:

75 “ICANN Staff shall prepare an Issues Report with respect to ‘fast flux’ DNS changes, for
76 deliberation by the GNSO Council. Specifically the Staff shall consider the SAC Advisory
77 [SAC 025], and shall outline potential next steps for GNSO policy development designed to
78 mitigate the current ability for criminals to exploit the DNS via ‘fast flux’ IP or nameserver
79 changes.”

80

81 **3.1.2 GNSO Issues Report on Fast Flux Hosting**

82 In response to the request of the GNSO Council, ICANN Staff considered the SSAC
83 Advisory (SAC 025), and consulted other appropriate and relevant sources of information on
84 the topic of fast flux hosting. Its findings were published in the issues report on 31 March
85 2008. Based on these findings ICANN Staff recommended that “the GNSO sponsor further

¹ <http://www.icann.org/committees/security/sac025.pdf>

² Although the report (SAC 025) refers only to “agreements,” the SSAC presentation on Fast Flux Hosting at the February 2008 ICANN meeting in Delhi (<http://delhi.icann.org/files/presentation-rasmussen-fast-flux-13feb08.pdf>) made it clear that the intended reference is to “accreditation agreements.”

86 fact-finding and research concerning guidelines for industry best practices before
87 considering whether or not to initiate a formal policy development process". It furthermore
88 noted that "the completion of concrete fact-finding and research will be critical in informing
89 the community's deliberations".

90

91 **3.1.3 Council Resolution & WG Charter**

92

93 At its 8 May 2008 meeting, the GNSO Council initiated a formal policy development process
94 (PDP) and called for creation of a working group on fast flux. Subsequently, at its 29 May
95 2008 meeting, the GNSO Council approved a working group charter to consider the
96 following questions:

97

- 98 • Who benefits from fast flux, and who is harmed?
- 99 • Who would benefit from cessation of the practice and who would be harmed?
- 100 • Are registry operators involved, or could they be, in fast flux hosting activities? If so,
101 how?
- 102 • Are registrars involved in fast flux hosting activities? If so, how?
- 103 • How are registrants affected by fast flux hosting?
- 104 • How are Internet users affected by fast flux hosting?
- 105 • What technical (e.g. changes to the way in which DNS updates operate) and policy (e.g.
106 changes to registry/registrar agreements or rules governing permissible registrant
107 behavior) measures could be implemented by registries and registrars to mitigate the
108 negative effects of fast flux?
- 109 • What would be the impact (positive or negative) of establishing limitations, guidelines, or
110 restrictions on registrants, registrars and/or registries with respect to practices that
111 enable or facilitate fast flux hosting?
- 112 • What would be the impact of these limitations, guidelines, or restrictions to product and
113 service innovation?
- 114 • What are some of the best practices available with regard to protection from fast flux?

115

116 The group was also tasked to obtain expert opinion, as appropriate, on which areas of fast
117 flux are in scope and out of scope for GNSO policy making.

118

119 **3.2 Issue Background**

120

121 *N.B. Please note that the following content is taken from the GNSO Issues Report on*
122 *Fast Flux Hosting – 31 March 2008 and does not reflect the opinion of the Working*
123 *Group on the issue. Indeed, one of the major conclusions of this working group is*
124 *the need to further study and refine the definition of “fast flux” before undertaking*
125 *further steps. Please look to the body of this report for further discussion.*

126

127 “Fast flux” refers to rapid and repeated changes to A and/or NS resource records in a DNS
128 zone, which have the effect of rapidly changing the location (IP address) to which the
129 domain name of an Internet host (A) or name server (NS) resolves. Although some
130 legitimate uses for this technique are known (see below), it has within the past year become
131 a favorite tool of phishers and other cybercriminals who use it to evade detection by anti-
132 crime investigators.

133

134 **How fast flux works**

135

136 *N.B. Please note that the following content is based on, and in some cases taken*
137 *verbatim from, the description at <http://www.honeynet.org/papers/ff/fast-flux.html> and*
138 *does not reflect the opinion of the Working Group on the issue. Again the working*
139 *group wishes to emphasize the need to further study and refine the operational*
140 *definition of “fast flux” before undertaking further steps. Please look to the body of*
141 *this report for further discussion.*

142

143 The goal of fast-flux is for a fully qualified domain name (such as www.example.com) to
144 have multiple IP addresses (sometimes hundreds or even thousands) assigned to it. These
145 IP addresses are changed in and out of zone file A (host address) and/or NS (name server)
146 records, sometimes using round-robin IP addresses and/or short time-to-live (TTL). Web site
147 host names may be associated with a new set of IP addresses which can change rapidly. A
148 browser connecting to the same web site repeatedly over a short period of time could
149 actually be connecting to a different infected computer each time. In addition, the attackers
150 ensure that the compromised systems they are using to host their scams have the best
151 possible bandwidth and service availability. They often use a load-distribution scheme which
152 takes into account node health-check results, so that unresponsive nodes are taken out of
153 the pool and content availability is always maintained.

154

155 Proxy redirection adds a second layer of obfuscation to fast flux. When someone hosting
156 malicious content (a phishing site, for example) uses a fast-flux network, the hosts that are
157 “fluxed” (by rapidly changing the configuration of the malicious host network) are typically
158 proxies that redirect queries to the site that contains the attacker’s actual content. That’s
159 simpler for the attacker, because instead of having to copy his malicious content to many
160 different bots, he can put it on one host, and deploy a botnet of redirecting proxies that all
161 point to that host. The fluxing then takes place among the redirectors. Redirection disrupts
162 attempts to track down and mitigate fast-flux service network nodes. The domain names and
163 URLs for advertised content no longer resolve to the IP address of a specific server, but
164 instead fluctuate amongst many front-end redirectors or proxies, which then in turn forward
165 content to another group of backend servers. While this technique has been used for some
166 time in the world of legitimate web server operations, for the purpose of maintaining high
167 availability and spreading load, in this case it is evidence of the technological evolution of
168 criminal computer networks.

169

170 Fast-flux “motherships” are the controlling element behind fast-flux service networks, and
171 are similar to the command and control (C&C) systems found in conventional botnets.
172 However, compared to typical botnet servers, fast-flux motherships have many more
173 features. It is the upstream fast-flux mothership node, which is hidden by the front end fast-
174 flux proxy network nodes, that actually delivers content back to the victim client who
175 requests it. Certain fast flux command and control systems employ peer to peer (P2P)
176 applications and so operate successfully for extended periods of time in the wild. These
177 nodes are often observed hosting both DNS and HTTP services, with web server virtual
178 hosting configurations able to manage the content availability for thousands of domains
179 simultaneously on a single host.

180

181 Fast-flux is a technique that is used to enhance the longevity and robustness of networks
182 which support many malicious practices, including online pharmacy shops, money mule
183 recruitment sites, phishing web sites, extreme/illegal adult content, malicious browser exploit
184 web sites, and the distribution of malware downloads. Beyond DNS and HTTP, other
185 services such as SMTP, POP, and IMAP can be delivered via fast-flux service networks.
186 Because fast-flux techniques utilize TCP and UDP redirects, any directional service protocol

187 with a single target port would likely encounter few problems being served via a fast-flux
188 service network—so it's not just web sites; it could also be fraudulent email sites.

189 **Legitimate uses of fast flux**

192 The working group conducted research which developed evidence that legitimate, high-
193 capacity load-balancing systems, and legitimate “volatile” or rapid-update-dependent
194 services, rely on short time-to-live values in the DNS records that resolve their principal
195 domain names (e.g., www.google.com) to IP addresses in order to propagate changes
196 quickly. A high-traffic site might use this technique—which satisfies some narrow definitions
197 of “fast flux”—to adapt its home page addresses to internal and external network conditions,
198 such as server load, outages, user location, and resource reconfiguration. The ability to
199 reconfigure quickly is considered by these service providers to be important enough to offset
200 the additional query latency introduced by more-frequent DNS lookups.

- Marika Konings 9/23/08 12:17 PM
Deleted: preliminary
- Marika Konings 9/23/08 12:17 PM
Deleted: anecdotal
- Marika Konings 9/23/08 12:17 PM
Deleted: some
- Marika Konings 9/23/08 12:17 PM
Deleted: may

202 The working group also explored the use of fast flux by service providers wishing to deal
203 with situations in which a government or other actor is deliberately preventing access to their
204 services from within a country or region, or is engaged in broader censorship. This was
205 described as a possible “legitimate use”.

Marika Konings 9/23/08 12:20 PM
Deleted: More research is needed to better understand legitimate uses and their prevalence, once a more robust definition of “fast flux” has been developed.

207 **Tentative Illicit Uses of Fast Flux**

209 Phishing, pharming, and other malicious (and frequently illegal) activities represent a well-
210 known threat to the safety and security of Internet users. Those engaged in these activities
211 can frustrate the efforts of investigators to locate and shut down their operations by using
212 fast flux service networks to rapidly and continuously change the topology of the network on
213 which their content is hosted, staying “one step ahead” of their law-enforcement pursuers.

Marika Konings 9/23/08 12:21 PM
Deleted: anecdotally

Marika Konings 10/13/08 10:09 AM
Deleted: Why fast flux is a problem

215 Fast-flux service networks create robust, obfuscating service delivery infrastructures that
216 make it difficult for system administrators and law enforcement agents to shut down active
217 scams and identify the criminals operating them.

218

219

219 4 Approach taken by the Working Group

220 The Fast Flux Working Group started its deliberations on 26 June 2008 with an informal
 221 meeting during the ICANN Paris meeting where it was decided to continue the work primarily
 222 through weekly conference calls, which started on 11 July 2008. The group decided to start
 223 working on answering the charter questions in parallel to the preparation of constituency
 224 statements on this topic. In order to facilitate the feedback from the constituencies, a
 225 template was developed for responses (see Annex I). The initial idea was to have a first
 226 round of informal constituency statements, followed by a final round of constituency
 227 statements following the first draft of the initial report.

228
 229 In addition to the weekly conference calls, extensive dialogue occurred through the fast flux
 230 mailing list. Over 490 e-mails have been posted to the mailing list as of this writing, not
 231 taking into account messages that were sent between individual Working Group members
 232 on the topic.

233
 234 In order to reflect that many positions in this report are not consensus views, it was agreed
 235 by the Working Group to use the following labels to indicate the level of support for a certain
 236 position:

- 237 ▪ Agreement – there is broad agreement within the Working Group (largely equivalent to
 238 “rough consensus” as used in the IETF)
- 239 ▪ Support – there is some gathering of positive opinion, but competing positions may exist
 240 and broad agreement has not been reached
- 241 ▪ Alternative view – a differing opinion that has been expressed, without garnering enough
 242 following within the WG to merit the notion of either Support or Agreement.

244 4.1 Members of the Working Group

245
 246 Tentative/ It should be emphasized that statements and contributions made by individual
 247 members of the Working Group in the course of this policy development process are made
 248 on an individual title and are not necessarily representative for their respective constituency.

257 5 Discussion of Charter Questions

258

259 The following is a distillation from e-mail threads and Working Group conference calls. As far
260 as possible, answers to the charter questions have been clustered together in different
261 groupings. Due to the challenges outlined in Chapter 6, the Working Group abandoned the
262 effort to provide answers to charter questions or reach consensus, but focused instead on
263 issues such as the definition of fast flux, reviewing different fast flux data sources and
264 describing options for next steps.

265

266 **Fast flux [characteristics](#)**

Marika Konings 9/18/08 2:00 PM
Deleted: definition

267

268 *Note: Although it is not one of the explicitly stated “charter questions,” the question*
269 *“what is fast flux?” was determined to by the working group to be a crucial*
270 *underpinning of any further discussion. The working group feels that this*
271 *conversation needs to be continued and completed as the first order of business in*
272 *any subsequent effort. The working group developed the following preliminary*
273 *[characteristics](#), but did not reach consensus and offers this draft as a way to capture*
274 *progress to date.*

Marika Konings 9/18/08 2:01 PM
Deleted: working definition

275

276 “A Fast Flux [attack](#) network, for the purposes of this working group, [exhibits the following](#)
277 [characteristics](#):

278

- 279 • [Some but not necessarily all of the network nodes are](#) operated on [compromised](#)
280 [hosts](#) (i.e., using software that was installed on hosts without notice or consent to the
281 [system operator/owner](#));
- 282 • Is ‘volatile’ in the sense that the active nodes of the network change in order to
283 sustain the network’s lifetime, facilitate the spread of the network software
284 components, and to conduct other attacks; and
- 285 • Uses a variety of techniques to achieve volatility including:
 - 286 – (rapid) modification of IP addresses for malicious content hosts, name servers,
287 and other network components via DNS entries with low TTLs;
 - 288 – dispersing network nodes across a wide number of consumer grade autonomous
289 systems;

Marika Konings 9/23/08 12:27 PM
Deleted: Is

Marika Konings 9/23/08 12:27 PM
Deleted: one or more

- 290 – monitoring member nodes to determine/conclude that a host has been identified
291 and shut down; and
292 – time, or other metric-based, topology changes to network nodes, name server,
293 proxy targets or other components.”

294

295 [Additional characteristics that in combination or collectively have been used to distinguish or](#)
296 [“fingerprint” a fast flux hosting attack include:](#)

- 297 – [multiple IPs per NS spanning multiple ASNs.](#)
298 – [frequent NS changes.](#)
299 – [in-addrs or IPs lying within consumer broadband allocation blocks,](#)
300 – [domain name age.](#)
301 – [poor quality WHOIS,](#)
302 – [determination that the nginx proxy is running on the addressed machine: nginx is](#)
303 [commonly used to hide/proxy illegal web server](#)

304

305 [\[Tentative\] There was support in the Working Group to add the following characteristics:](#)

- 306 – [Elements of the attack network run on compromised computers](#)
307 – [Whois records are fraudulently created \(e.g. using stolen identities or payment](#)
308 [methods\)](#)

309

310 [The distribution and use of software installed on hosts without notice to or consent of the](#)
311 [system operator/owner is a critically important characteristic of a fast flux attack network; in](#)
312 [particular, it is one among several characteristics that distinguish fast flux attack networks](#)
313 [from production uses of fast flux techniques in applications such as content distribution](#)
314 [networking, high availability and resiliency networking, etc.](#)

315

316 In order to constrain the working definition of “fast flux” to lie “within the scope of ICANN to
317 address,” the WG also tentatively agreed to limit the definition to the operation of the DNS
318 and its registration system, specifically excluding (a) the accuracy of WHOIS information (an
319 issue which is being considered in a broader ICANN conversation, and is not unique to fast
320 flux) and (b) the question of what constitutes “criminal intent.”

321

322 **Charter questions**

323

324 5.1 Who benefits from fast flux, and who is harmed?

325

326 *Note: While there is not consensus on this point, a majority of working group*
327 *members feel that it is important to note that “fast flux,” as defined above, is a*
328 *technique which is beneficial or harmful only to the extent that it is used to conduct*
329 *beneficial or harmful activities. The WG found it impossible to come to consensus*
330 *around the answers to questions of “who uses fast flux ‘legitimately’, who uses it*
331 *‘maliciously,’ and who is harmed by either use?” because of the difficulty associated*
332 *with determining or assigning intent and legality. It also should be noted that the way*
333 *in which fast flux has been characterised above, as an attack technique related to*
334 *compromised hosts, would make it inconsistent to speak about ‘benefits’.*
335 *Nevertheless, the WG did identify a number of benefits that are outlined below.*

Marika Konings 9/18/08 2:02 PM

Deleted: defined

336

337 Who benefits from fast flux?

338

339 [Production applications of volatile networks may exhibit some but not all characteristics](#)
340 [ascribed to fast flux attack networks. For example, the Working Group assumes that](#)
341 [unauthorized software operated on compromised hosts would not participate in or contribute](#)
342 [to the intended and beneficial use of such volatile networks.](#)

343

344 The WG identified the following ways in which fast flux techniques either are or plausibly
345 could be used for legitimate purposes, without reaching consensus on whether or not any or
346 all of these uses actually occur, or whether the beneficial uses depend on fast flux
347 techniques or could be pursued using other means of roughly equivalent efficacy and
348 convenience.

349

350 1. Organizations that operate highly targetable networks

351

352 Organizations that operate highly targetable networks (e.g., government and military/tactical
353 networks) that must adhere to very stringent availability metrics and use short TTLs to
354 rapidly relocate network resources which may come under attack.

355

356 ~~[Tentative] In addition, there was agreement to include, while those sorts of networks~~
357 ~~employ short TTLs, short TTLs – in and of themselves – are insufficient to characterize a~~

358 domain name as 'fast flux'. TTLs become an issue for fast flux-related work primarily
 359 because at least one Internet Draft, [ftp://ftp.rfc-editor.org/in-notes/internet-drafts/draft-](ftp://ftp.rfc-editor.org/in-notes/internet-drafts/draft-bambenek-doubleflux-01.txt)
 360 [bambenek-doubleflux-01.txt](ftp://ftp.rfc-editor.org/in-notes/internet-drafts/draft-bambenek-doubleflux-01.txt) (URL broken due to length) focuses primarily on establishing
 361 minimum TTLs as an approach to limiting fast flux. If constraints were to be applied to TTLs
 362 in an effort to limit fast flux, this would impact organizations which rely on short TTLs in order
 363 to be able to relocate resources as part of the process of mitigating distributed denial of
 364 service attacks, would impact organizations moving nameservers, and would impact
 365 organizations which rely on short TTLs in order to provide a variety of legitimate services,
 366 among others.

367
 368 [tentative] As an alternative viewpoint, the following was offered: there are legitimate uses
 369 of short TTL values, and artificially limiting TTLs via consensus policies will simply move the
 370 problem beyond the purview of ICANN/ccTLDs and private DNS networks).

371
 372 **2. Content distribution networks**

373
 374 Content distribution networks such as Akamai, where "add, drop, change" of servers are
 375 common activities to complement existing servers with additional capacity, to load balance
 376 or location-adjust servers to meet performance metrics (latency, for example, can be
 377 reduced by making servers available that are fewer hops from the current most active locus
 378 of users and by avoiding lower capacity or higher cost international/intercontinental
 379 transmission links).

380
 381 **3. Free speech / advocacy groups**

382
 383 Organizations that provide channels for free speech, minority advocacies, and so on, may
 384 use short TTLs and operate fast-flux like networks. The group was presented with a case
 385 study of a service that uses fast-flux methods to purportedly allow Web users to circumvent
 386 Internet content censorship (<http://forum.icann.org/lists/gnso-ff-pdp-may08/msg00371.html>).

Marika Konings 9/23/08 2:05 PM
 Deleted: and activities
 Marika Konings 9/23/08 2:05 PM
 Deleted: , revolutionary thinking
 Marika Konings 9/23/08 2:06 PM
 Deleted: to avoid detection

387
 388 **Possible minority view**

389
 390 Some indicated that there is a lack of evidence to actually support this category (free
 391 speech / advocacy) as benefitting from fast flux. Some indicated that there is a lack

Marika Konings 9/23/08 2:08 PM
 Deleted: Other techniques are used by these groups to avoid discovery, not fast flux, or at least no evidence has been provided to support this.

392 [of evidence to actually support this category \(free speech / advocacy\) as benefiting](#)
393 [from fast flux. Techniques other than Fast Flux \(such as TOR\) are used by these](#)
394 [groups to avoid discover.](#) Other working group members point out that operators of
395 networks in this category are understandably reticent, and that information about
396 these networks will always be very difficult to obtain.
397

398 **"Who is harmed by fast flux activities?"**

399

400 The WG noted that harm could arise from both legitimate and malicious uses of fast flux
401 techniques, and WG members found it difficult during their discussions to maintain a clear
402 distinction between harms that arise directly from the techniques themselves (e.g., rapid
403 reconfiguration of network topologies using techniques such as short TTLs and rapid
404 changes to information in A or NS records) and harms that arise from the malicious behavior
405 of "bad actors" who may use fast flux as one of many techniques to avoid detection and
406 termination of their activities (spamming, phishing, etc.) by law enforcement or other anti-
407 crime agencies. This difficulty appears to be responsible for the persistent disagreement
408 within the WG concerning the extent to which "fast flux" is or is not a culpable element of
409 "malicious behavior" (which itself remains a poorly-defined term).
410

411 [\[Tentative\] In addition, there was agreement for the following addition: Some in the working](#)
412 [group would point to the way in which fast flux nodes are created as prima-facie evidence of](#)
413 [fast flux techniques constituting malicious behaviour. Recall that fast flux nodes are created](#)
414 [by compromising hosts with malicious software installed without the knowledge or consent of](#)
415 [the system's operator/owner. With respect to malicious behaviours enabled by fast flux, one](#)
416 [non-subjective definition of "malicious behaviour" would be, "Activities which are illegal under](#)
417 [the laws or regulations of a country having jurisdiction over the activity in question." For](#)
418 [example, in the United States, malicious activities enabled by fast flux might include, among](#)
419 [other things,](#)

- 420 [- Cyber intrusions/unauthorized access to computers and networks](#)
- 421 [- Phishing \(forgery and social engineering attacks meant to induce users to reveal sensitive](#)
422 [financial credentials\)](#)
- 423 [- Carding \(trading and misuse of credit card numbers and other financial credentials\) -](#)
424 [Distribution of viruses or other malware](#)
- 425 [- Distribution of child pornography](#)

426 - Distribution of narcotics or other scheduled controlled substances without a valid
 427 prescription

428 - Distribution of knockoff/counterfeit versions of trademarked or copyrighted property such
 429 as watches, purses, computer software, movies or music

430

431 [Tentative] One alternative view was expressed in relation to the previous addition noting
 432 that due process needs to be observed. People can be falsely accused of a crime.
 433 Determination of guilt is something that should be left to the court system.

434

435 Although the WG did not reach consensus concerning the separately identifiable culpability
 436 of fast flux hosting with respect to the harm caused by malicious behavior, it recognized the
 437 way in which fast flux techniques are used to prolong an attack:

438

439 “[A] ‘flux’ domain attack lasts about twice to six times longer than any other kind of
 440 phishing site. Here’s a reference to an excellent paper on this by Tyler Moore and
 441 Richard Clayton of Cambridge from last year on the topic of phishing site uptimes
 442 that breaks this out based on hard data:

443 (<http://www.cl.cam.ac.uk/~rnc1/ecrime07.pdf>). So these flux techniques keep a site
 444 up at least twice as long, much longer on many occasions.”⁵

445

446 *Note: The WG did not answer the following charter-questions due to the lack of:*

- 447 • *A robust technical, and process, definition of “fast flux”,*
- 448 • *Reliable techniques to detect fast flux networks while maintaining an*
 449 *acceptable rate of false positives,*
- 450 • *Reliable information as to the scope and penetration of fast flux networks,*
- 451 • *Reliable information as to the financial and non-financial impact of fast flux*
 452 *networks*

453

454 **5.2 Who would benefit from cessation of the practice and who would be harmed?**

455

456 [Who is harmed by fast flux techniques when used in support of attack networks?](#)

457

458 [1. Individuals whose computers are infected by attackers and subsequently used to host](#)

⁵ From a message by Rodney Joffe to the WG email list.
 Initial Report on Fast Flux Hosting
 Authors: TBC

459 [facilities in a fast flux attack network \(e.g., nginx proxies, nameservers or web sites\). The](#)
460 [individual may have his Internet connection blocked. In the extreme, should the computer be](#)
461 [suspected of hosting illegal material \(e.g., child pornography\), the computer may be seized](#)
462 [by law enforcement agents \(LEAs\) and the individual may be subjected to a criminal](#)
463 [investigation.](#)

464
465 [In addition:](#)

- 466 – [even if their connection doesn't end up completely blocked, users may experience](#)
467 [degraded performance \(as computer or network resources get consumed by the](#)
468 [parasitic miscreant user\(s\) of their system\)](#)
- 469 – [also, even if the ISP doesn't block the infected user, remote ISPs may end up blocking](#)
470 [all or some traffic from the user, e.g., as a result of the user's IP being listed on a DNS](#)
471 [block list](#)
- 472 – [the user may be \(repeatedly\) diverted from a normal connection to a walled garden](#)
473 [where the only resources they can access are remediation sites or tools](#)
- 474 – [a user's systems may become unstable as a result of malware which was installed to](#)
475 [enable fast fluxing \(even some *vendors* have trouble building patches that are safe for](#)
476 [*all* version/patch permutations, so it shouldn't be surprising if some malware also](#)
477 [causes stability issues\)](#)

478
479 [Some specific examples of how users can be harmed by this, beyond what's already been](#)
480 [mentioned, can be seen in things like:](#)

- 481 – [increased operational complexity and loss of Internet transparency as operators](#)
482 [implement increasingly draconian measures in an effort to control abuse from potentially](#)
483 [compromised users](#)
- 484 – [costs associated with the prophylactic purchase of antivirus products, home firewall](#)
485 ["routers" and other security products meant to keep bots and other security threats at](#)
486 [bay](#)
- 487 – [clean up costs when prophylactic measures fail \(e.g., when a non-technical user needs](#)
488 [to hire a technician to help them try to get uninfected\)](#)
- 489 – [in the case of users who get dropped by their ISP, or who become so disgusted with](#)
490 [their ISP that they leave, the costs associated with moving from one ISP to another,](#)
491 [including both direct contractual costs \(such as potentially overlapping subscription](#)
492 [costs, or disconnection and connection fees\), as well as indirect costs such as changes](#)

493 [in email addresses \(with attendant lost or delayed email\), time spent learning the ins-](#)
494 [and-outs of a new ISP, time spent reconfiguring systems to use the new ISP, etc.](#)

495

496 [2. Businesses and organizations whose computers are infected and subsequently to host](#)
497 [facilities in a fast flux attack network. These organizations may have Internet connections](#)
498 [blocked, which may result in loss of connectivity for all users and customers, as well as the](#)
499 [possible loss of connectivity for any Internet services also hosted via the blocked connection](#)
500 [\(e.g., mail, web, e-merchant or ecommerce sites\). Again, in the extreme, should the](#)
501 [computer be suspected to host illegal material, the computer may be seized by LEAs and](#)
502 [the individual may be subjected to a criminal investigation. If this computer were hosting web](#)
503 [and other services for the business/organization, the seizure could also result in an](#)
504 [interruption of service, loss of income or "web presence". Registries may suspend name](#)
505 [resolution of the organization's domain if ordered by courts or LEAs.](#)

506

507 [A compromised system in a business environment also immediately raises the dreaded](#)
508 [spectre of a breach of personally identifiable information \(PII\). If PII was present on the](#)
509 [compromised machine, notification may be mandated by statute, which may result in](#)
510 [substantial direct costs to the affected organisation. PII-related worries also drive the](#)
511 [substantial costs associated with deployment of whole disk encryption. Some businesses](#)
512 [may also be affected by specific laws e.g. GLBA or HIPAA which apply to financial](#)
513 [institutions or health care institutions, respectively.](#)

514

515 [3. Individuals who receive phishing emails and are lured to a phishing site hosted on a fast](#)
516 [flux attack network may have their identities stolen or suffer financial loss from credit card,](#)
517 [securities or bank fraud. \[Tentative\] Those losses may include both direct losses which a](#)
518 [financial institution declines to make whole, as well as indirect costs \(potentially higher](#)
519 [interest rates, reduced credit lines, declined credit applications, etc.\) Identity theft can also](#)
520 [touch on national security issues, if stolen identity information is used to illegally cross](#)
521 [borders, to illegally remain in a country or to work without permission, or to purchase items](#)
522 [or services \(such as weapons or airline travel\) that might not otherwise be available if a](#)
523 [person used their real identity.](#)

524

525 [They may unwittingly disclose medical or personal information that could be used for](#)
526 [blackmail or coercion. \[Tentative\] There was support to add: or for discriminatory treatment](#)

527 by employers concerned with potential costs associated with identified (but latent) genetic
 528 conditions, for example. Fear that medical record systems are porous may also deter some
 529 individuals from even seeking help ("I'd like to find out what's causing my condition, but I'm
 530 afraid that if I go in, the whole town will know I have <whatever>"). Individuals who purchase
 531 bogus products, especially pharmaceuticals, may be physically harmed from using such
 532 products. **[Tentative]** There was support to add: this harm can occur in a variety of ways.
 533 For example: -- teenagers might have uncontrolled access to narcotics, steroids or other
 534 dangerous controlled substances, with potentially tragic consequences. - women attempting
 535 to purchase birth control patches online might be sold adhesive bandages with no active
 536 ingredient whatsoever instead -- cancer patients, rather than receiving efficacious treatment
 537 from a licensed physician, might rely on bogus online herbal "cures" that actually do nothing
 538 to treat their disease, again, potentially resulting in deaths or serious complications. Illegal
 539 generic drugs also undercut the incentive for pharmaceutical firms to invest in new drug
 540 research by cutting into their earning stream while their discovery is, or should be protected
 541 by patents. Sale of counterfeit products is another example of how fast flux networks can
 542 result in users and businesses being harmed. Counterfeit products may undermine the value
 543 of carefully nurtured brand names, leave consumers with shoddy or dysfunctional products,
 544 deny nations legitimate customs revenues associated with the importation of premium
 545 brand-name products, or result in unsafe products (for example as a result of counterfeit UL-
 546 listed electrical appliances cords).

Marika Konings 10/13/08 10:51 AM

Deleted: They may infect their computers with malicious software that would "enlist" their computers into a bot herd.

548 4. **[Tentative]** Internet service providers are harmed when their IP address blocks and their
 549 domain names are associated with fast flux attack networks. These operators also bear the
 550 burden of switching the unauthorized traffic that fast flux attack networks generate and they
 551 may also incur the cost of diverting staff and resources to respond to abuse reports or legal
 552 inquiries. **[Tentative]** Agreement was expressed to also add: or helping users to get cleaned
 553 up, or purchasing antivirus products to hand out to users, or deploying network-based
 554 remediation solutions. ISPs are harmed when spammers send spam spamvertising fast flux
 555 hosted sites, and the ISP get deluged with that fast flux-enabled spam. ISPs may also
 556 experience excess DNS-related traffic as a result of fast flux, resulting in the need for them
 557 to deploy additional recursive resolver capacity. ISPs may also be forced to deploy deep
 558 packet inspection equipment or other networking equipment to detect and respond to fast
 559 flux hosted sites on customer systems. (Because fast flux web sites can be easily hosted on
 560 arbitrary ports, port-based blocking solutions won't work to control fast flux hosting, unlike

Marika Konings 10/13/08 10:56 AM

Deleted: access operators

561 port 25 blocks deployed to control direct-to-MX spam)

562

563 5. Registrars may be reputationally harmed when their registration and DNS hosting
564 services are used to facilitate fast flux attack networks that employ "double flux" techniques.
565 Like Internet access providers, they may also incur the cost of diverting staff and resources
566 to monitor abuse, or to respond to abuse reports or legal inquiries. [Tentative] Registrars
567 currently see wdprs.internic.net complaints in conjunction with fast flux domain simply
568 because that's the sole complaint mechanism currently available which potentially reaches
569 fastflux domain name abuse. Antispam activists have thus become very good at carefully
570 scrutinizing spamverified fast flux domain names for whois problems. Dealing with those
571 WDPRS reports represents an additional registrar-specific cost. Providing a reporting
572 channel that focusses on the actual issue (a domain has been detected which is engaged in
573 criminal activity) rather than the substitute issue (there's a problem with the domain's whois
574 data), will clarify the problem at hand.

575

576 6. Businesses and organizations who are "phished" from bogus web sites hosted on fast flux
577 attack networks may experience financial or material loss, tarnish to brand, or loss of
578 customer/consumer confidence. They also incur the cost associated with brand abuse
579 monitoring, detection and mitigation.

580

581 7. Individuals or businesses whose lives or livelihoods are affected by the illegal activities
582 abetted through fast flux attack networks, as are persons who are defrauded of funds or
583 identities, whose products are imitated or brands infringed upon, and persons who are
584 exploited emotionally or physically by the distribution of images or enslavement. [Tentative]
585 There was support to add: Examples of these ills can be seen in things such as child
586 pornography, unauthorized distribution of proprietary software ("warez"), unauthorized
587 distribution of copyrighted music and movies, unauthorized distribution of counterfeit "knock-
588 off" trademarked merchandise, etc.

589

590 8. Registries may incur the cost of diverting staff and resources to monitor abuse or to
591 respond to abuse reports or legal inquiries relating to fast flux attack network activity.
592 [Tentative] Uptake/legitimate use of some TLDs may also be impacted by fast flux abuse. If
593 the public perceives that sheer use of a domain from a particular TLD may result in negative
594 scoring by anti-spam software such as SpamAssassin, that can be a powerful disincentive

595 hindering the adoption and use of that registry's TLD.

596

597 Who benefits from the use of fast flux techniques? **[Tentative]** Short TTLs" per se are NOT

598 synonymous with "fastflux." Short TTLs are only one characteristic associated with fastflux

599 domains.

600

601 1. Organizations that operate highly targetable networks (e.g., government and

602 military/tactical networks) strive to adhere to very stringent availability metrics and use short

603 TTLs specifically (and other fast flux techniques as appropriate) to rapidly relocate network

604 resources which may come under attack. Note: Targeting a dotted quad rather than a FQDN

605 is generally preferred by intelligent attackers because this method is more difficult to detect

606 and isolate the attack origin(s).

607

608 2. Content distribution networks such as Akamai use fast flux techniques for situations

609 where "add, drop, change" of servers are common activities to complement existing servers

610 with additional capacity, to load balance or location-adjust servers to meet performance

611 metrics (latency, for example, can be reduced by making servers available that are fewer

612 hops from the current most active locus of users and by avoiding lower capacity or higher

613 cost international/intercontinental transmission links). **[Tentative]** Some providers may also

614 selectively return different IP addresses in response to DNS queries from different

615 audiences -- e.g., you might get German content if you're connecting from what appears to

616 be a German IP address, or French content if you're connecting from what appears to be a

617 French IP address.

618

619 3. Organizations that provide channels for free speech, minority advocacies, and activities,

620 revolutionary thinking may use fast flux techniques to avoid detection.

621

622 4. Criminals, terrorists, and generally, any organization that operates a fast flux attack

623 network at public expense, harm or detriment benefit from the use of fast flux techniquesⁱⁱ.

624

625 The working group recognizes that future uses of this technology may be developed and

626 that, as a result, it is impossible to list all possible beneficial and harmful uses of this

627 technology. Those using fast flux for criminal purposes have had an incentive to develop

628 uses more quickly than legitimate users in order to stay ahead of security and law

629 [enforcement efforts. Because of this and because of the private and academic research](#)
630 [efforts focused on criminal uses of fast flux, the working group likely has a clearer picture of](#)
631 [the illicit uses of this technology than the legitimate ones. Nevertheless, there are likely both](#)
632 [criminal and legitimate uses of this technology that are unknown and unknowable at this](#)
633 [time.](#)

634 -----

635 **5.3 Are registry operators involved, or could they be, in fast flux hosting**
636 **activities? If so, how?**

637
638 [\[Tentative\] There was agreement to add that in its Constituency Input Statement \(attached](#)
639 [to this report as an annex\), the RvC provided detailed notes regarding the technical and](#)
640 [policy options available to registry operators regarding fast-flux hosting. The RvC statement](#)
641 [includes technical notes about how the DNS functions, the data available to registry](#)
642 [operators, fast-flux detection methods, uses of short TTLs, and other pertinent items. The](#)
643 [RvC's answers to question 3 question 7 are of interest in this context.](#)

644

645 **5.4 Are registrars involved in fast flux hosting activities? If so, how?**

646

647 **5.5 How are registrants affected by fast flux hosting?**

648

649 **5.6 How are Internet users affected by fast flux hosting?**

650

651 [\[Tentative\] Introduction](#)

652

653 [While most Internet users have never heard of fast flux hosting, a growing number of them](#)
654 [are nonetheless directly affected by it. Internet users provide both the raw material that fast](#)
655 [flux hosting runs on \(malware-compromised broadband-connected consumer PCs\), while](#)
656 [also serving as the target audience for the spamvertised web sites which fast flux enables.](#)
657 [Internet users are thus central to the entire fast flux problem, and unless it is handled](#)
658 [appropriately, they are also the ones who may be subject to further restrictions and loss of](#)
659 [internet transparency](#)

660

661 [Malware, Spam, and Bots](#)

662

663 To understand how consumer PCs came to be converted into fastflux nodes, we need to
664 step back for a moment and consider the related problems of malware and spam. Internet
665 miscreants use malware -- viruses, worms, trojan horses, etc. -- to efficiently gain control
666 over large numbers of vulnerable networked consumer PCs. Those compromised systems,
667 subject to remote manipulation by shadowy masters, are commonly known as "bots" or
668 "zombies." Having obtained control over those compromised PCs, the miscreants can then
669 use those bots as a base from which to search for additional vulnerable systems, as a
670 platform for sniffing network traffic, as a source of network attack ("DDoS") traffic, or most
671 commonly, to deliver spam directly to remote mail servers (so-called "direct-to-MX
672 spamming").

673
674 (Tentative) There was support to add.

675
676 What Are Miscreants to Do With Compromised Hosts That Can't Be Used for Spam
677 ?

678
679 The Messaging Anti-Abuse Working Group, a consortium of leading international ISPs, has
680 issued recommendations for managing port 25 traffic to defeat direct-to-MX spamming, see
681 <http://www.maawg.org/port25> If traffic on port 25 is blocked through following those
682 recommendations, as it now is at many ISPs worldwide, spam can no longer be sent directly
683 to remote mail servers from those compromised PCs (although non-spamming normal mail
684 users can still send regular mail). When the ISPs control port 25, that leaves the shadowy
685 "bot herders" with millions of compromised systems which are now incapable of directly
686 spamming remote mail servers.

687
688 Spammers and Other Internet Miscreants Have a Hard Time Getting Web Hosting.

689
690 At the same time, spammers (and other miscreants) find themselves confronting a second
691 orthogonal problem: it has become hard if not impossible for them to obtain and retain
692 mainstream web hosting for illegal content. While what's illegal will vary from jurisdiction to
693 jurisdiction, there are some categories of content which are illegal virtually everywhere,
694 including, among other things: -- narcotics, anabolic steroids and other dangerous drugs
695 distributed without a valid prescription -- child pornography -- viruses, trojan horses and
696 other malware -- stolen credit card information -- phishing web sites -- pirated intellectual

697 property, including pirated software ("warez"), copyrighted music and movies, and
698 trademarked consumer goods (most notably things such as premium watches, shoes,
699 handbags, etc.) In fact, many hosting companies specifically exclude hosting of any product
700 or service (whether legal or not) which has been "spamvertised" (advertised via spam),
701 because they recognize that to permit spamvertised products or services on their hosting
702 service will commonly result in their address space getting listed on one or more anti-spam
703 DNS block lists, such as those operated by Spamhaus (<http://www.spamhaus.org/>).

704
705 Miscreants Discover One Thing They CAN Do With Non-spamable Compromised Hosts

706
707 With that for background, it is easy to imagine what happened next: spammers repurposed
708 some of their "surplus inventory" of compromised-but-unspamable systems to provide "web
709 hosting" for illegal or spamvertised content which they couldn't host elsewhere.

710
711 (Tentative) There was agreement to add.

712
713 Reverse Proxies Are Used to Actually Deploy Fast Flux Hosting Networks

714
715 Spammers actually replicated all the hundreds or thousands of html files, images, databases
716 and other bits and pieces of content and software making up a sophisticated web site on
717 each of dozens or hundreds of fastflux hosts. That would be too complex, too error prone,
718 too time consuming, and too easily detected. Instead, spammers found that they could use
719 "reverse proxy" software to accept web connections on the compromised consumer host
720 tunnelling that traffic back to their actual (hidden) backend master host. "nginx" is one
721 product often used for that purpose, although it is also routinely used by regular web sites as
722 well. The compromised consumer PC then acts as if it were delivering web pages, but in
723 reality it is just acting as a pipeline to a hidden master web server (or farm of servers)
724 located elsewhere. [insert suitable illustration here showing reverse proxy setup here]

725
726 Use of Botted PCs is Non-Consensual and Surreptitious

727
728 The owner/user of a compromised PC doesn't know that his or her PC is being used as part
729 of a fast flux hosting network. No one asks the owner of the compromised PC, "Do you have
730 any objection if we use your computer to distribute stolen credit card numbers?" and no

731 warning light goes off on the compromised PC saying "Hey, someone's serving stolen
732 software from your system!" Typically the owner of the PC "only" becomes aware that they
733 have unwittingly become a participant in illegal online activity when: -- antivirus software, or
734 other security software, eventually detects the presence of malicious software on the system
735 -- someone complains to their ISP, and their ISP contacts the customer with the bad news
736 that they're infected -- the ISP disconnects the customer, blocks traffic to/from them, or plops
737 the customer into a quarantine zone where all they have access to are clean up-related sites
738 and tools -- the user finds their system has become slow or unstable, and takes steps to
739 figure out why. -- the user find that they can no longer access some remote network
740 resources because they've been blocked at those remote sites as a result of their infection,
741 or -- the user is visited by law enforcement officials investigating the illegal activity that has
742 been seen in conjunction with "the user's" connection.

743
744 **(Tentative)** There was agreement to add:
745 **Post Fast Flux Infection Cleanup**

746
747 Once the user discovers that they've been botted and used for fast flux purposes, they are
748 then left with the unenviable chore of trying to get their compromised system disinfected.
749 Because of the complexity of cleaning many malware infections, and the substantial
750 possibility that at least some lingering malware components may be missed during efforts at
751 cleanup, most experts recommend formatting compromised systems and reinstalling them
752 from scratch, however that can be a time consuming and laborious process, and one that
753 may be practically impossible if the user lacks trustworthy backups or cannot find original
754 media for some of the products they had been using. The need to deal with this mess is the
755 first tangible user impact of fast flux hosting, but one which only some unlucky Internet users
756 experience.

757
758 **(Tentative)** There was support to add:

759
760 **One Universal Impact of Fast Flux: Spam**
761 **The next effect of fast flux hosting is one which virtually all Internet users experience, and**
762 **that's spam. Remember, fast flux hosting exists to host illegal content or spamvertised**
763 **products or services. All of us receive spam, whether that's an occasional message that slips**
764 **through otherwise efficient filters, or a steady deluge that may have caused some of us to**

765 abandon email altogether. Without the ability to obtain reliable web hosting services,
766 spammers are left with only a few categories of potential spam, such as stock pump-and-
767 dump spam, where users don't need to visit a spamvertised web site to purchase a product
768 or service. Clearly spammers are powerfully motivated to find a takedown-resistant way to
769 host their web sites, and that's what fast flux has given them. With fast flux, if one
770 compromised machine is discovered and taken off line, another system will be ready to take
771 over. It thus becomes very difficult to "completely take down" the spammer's "web hosting"
772 unless you can: -- identify and take down the back-end hidden master web server -- take
773 down the domain name that's being spamvertising, or -- take down the name servers that
774 the spamvertised domain relies on.

775

776 *[Tentative]* There was agreement to add.

777

778 Fluxing "Name Servers" As Well As Web Sites: The Rise of "Double Flux"

779 Spammers quickly recognized that the name servers were a weak point in their scheme, so
780 they adapted by beginning to not just use compromised systems for web hosting, they also
781 began to use those systems to do DNS for their domains. A domain that does both its web
782 hosting and which gets its DNS service via compromised systems is normally referred to as
783 a "double fastflux" or "doubleflux" domain.

784

785 *[Tentative]* There was support to add.

786

787 Port Blocks Won't Work to Curtail Fast Flux Web Hosting

788

789 All of this malicious activity, taking place on systems that are not professionally
790 administered, resulted in ISPs endeavoring to control these phenomena via the network. It is
791 understandable why they were inclined to do so: blocking port 25 controlled the spewage of
792 spam, even if it did nothing to fix the underlying condition of the infected host, so maybe
793 something similar could be done to address fastflux and doubleflux abuse? Unfortunately,
794 unlike email where controlling port 25 is sufficient to control the emission of spam, when it
795 comes to fastflux web pages, web pages can be served on "any" arbitrary port (e.g., to
796 access a web server running on port 8088 instead of the default port 80, one might use a
797 URL such <http://www.example.com:8088/sample.html>).

798

799 **[Tentative]** Two alternative views were expressed stating that although there are many valid
800 arguments to avoiding port blocking, the phenomena of double fast-flux would never had
801 happened had ISPs routinely blocked inbound port 53. Those networks which routinely block
802 ports by default are not prone to have hosts participate in fastflux networks. In addition,
803 serving on an alternate port can be a signal that something is not kosher. If ISPs blocked
804 port 80, and then end users configured their systems to only read content from port 80, this
805 would allow them to avoid sites served by residential ISPs that might be compromised,
806 instead of professional webhosting companies.

807

808 **[Tentative]** Support was offered for the following:

809

810 **ISP Efforts to Control Fast Flux and Double Flux Result in Collateral Damage**

811

812 **Blocking http traffic from consumer web pages thus often results in ISPs deploying more**
813 **draconian solutions, such as banning all web servers from dynamic customer address**
814 **space, or deploying potentially expensive deep packet inspection (DPI) appliances to identify**
815 **fastflux or double flux traffic (at least until the spammers begin using SSL/TLS to defeat DPI.**
816 **The problem gets even more complex when double flux is involved. When name servers are**
817 **routinely hosted on consumer systems, controlling that DNS traffic requires managing port**
818 **53 traffic, blocking external DNS queries coming in to the name server running on the**
819 **compromised customer host, and typically also managing blocking or redirecting any DNS**
820 **traffic coming from the local customer base, permitting it only to access the provider's own**
821 **DNS recursive resolvers. This loss of Internet transparency can keep customers from readily**
822 **(and intentionally) using third party DNS servers (such as those offered to the Internet**
823 **community by OpenDNS), and may also complicate or preclude things such as accessing**
824 **access-limited information products delivered via DNS, such as some subscription DNS**
825 **block lists.**

826

827 **[Tentative]** There was agreement that in conclusion, Internet users see their systems used
828 without their permission by abusers who've set up fastflux nodes on them; they face the
829 daunting task of cleaning up those compromised systems once they discover what's
830 happened; they are the target of endless spam, spam that would be materially harder if
831 fastflux hosting didn't exist, and they experience a loss of Internet transparency as ISPs
832 struggle to control the fastflux and doubleflux problems on the network. The combination of

833 those effects can result in Internet users having a pretty bad experience, all thanks to the
834 choice by some Internet miscreants to use fast flux and double flux techniques.

835

836 **5.7 What technical (e.g. changes to the way in which DNS updates operate) and**
837 **policy (e.g. changes to registry/registrar agreements or rules governing**
838 **permissible registrant behavior) measures could be implemented by registries**
839 **and registrars to mitigate the negative effects of fast flux?**

840

841 *Note: Although the members of the WG did not reach consensus on the existence or*
842 *character of “the negative effects of fast flux,” and therefore did not agree on the*
843 *nature of “the problem,” they presented and discussed a number of potential*
844 *technical and policy approaches to dealing with it. This section summarizes the ideas*
845 *(“solutions”) that were discussed by the WG. The WG wishes to emphasize that until*
846 *“fast flux” is better defined and researched, there are insufficient underpinnings to*
847 *recommend any of these – they are presented here as a draft, to record incremental*
848 *progress.*

849

850 The solutions fall into two categories based on the type of involvement expected of ICANN
851 and its contracted or accredited parties (gTLD registries and registrars): those that would
852 require only the availability of additional or more accurate information, which could be used
853 (or not used) by other parties engaged in anti-fraud and related activities as they saw fit; and
854 those that would require or at least benefit from some degree of active participation by
855 ICANN and/or registries and registrars to identify and deter fraudulent or other “malicious”
856 behavior.

857

858 **Information sharing**

859

860 Solutions in this category focus on enhancing the ability of non-ICANN-affiliated parties to
861 deal with fraud and other abusive or malicious behavior without recruiting ICANN or its
862 affiliated registries and registrars as active agents of fraud detection or prevention. WG
863 members advocating or supporting this approach noted that it would not require ICANN or its
864 affiliates to decide what types of behavior are “abusive” or “malicious,” and therefore would
865 obviate the debate within the WG (and in the community at large) about how ICANN should
866 define that dimension of “the fast flux problem.”

867 The information sharing proposals discussed by the WG included the following ideas⁶:

- 868 • Make additional non-private information about registered domains available through
 869 DNS-based (not WHOIS⁷) queries (e.g., by defining new uses for TXT resource records),
 870 perhaps including the age of the domain, the number of name server changes made
 871 during a recent defined time interval, and the like. **[Tentative] There was support to add**
 872 **the following clarification: the DNS-based zone envisioned under this section need not to**
 873 **be offered by ICANN itself, nor the registries or registrars. Rather, private entities, given**
 874 **bulk access to the required data, might offer that data via DNS or another mechanism in**
 875 **the public interest. ICANN, the registries and the registrars need only provide bulk**
 876 **access to the required data already available through Whois (albeit currently available**
 877 **only at ad hoc low query volume levels).**
- 878 • Publish summaries of unique complaint volumes by registrar, by TLD, and by name
 879 server. Also provide a report by privacy protection service associated with complained-of
 880 domains.
 - 881 • Encourage ISPs to instrument their own networks, so they have visibility into what's
 882 being done with their resources, and to their customers.

883

884 Active engagement

885 Some of the “solution” ideas discussed by the WG focused on how ICANN and its affiliated
 886 registries and registrars might actively participate in efforts to discourage and deter or detect
 887 and stop “bad behavior” of various kinds, either by recommending voluntary changes to the
 888 way in which the DNS, registries, and registrars operate or by compelling changes through
 889 policies that would modify the contractual obligations of gTLD registries and/or the
 890 accreditation criteria for registrars. For the most part, these discussions were concerned
 891 more with the potential efficacy of actions and behaviors that ICANN might encourage or
 892 require rather than with the effective scope of ICANN’s involvement in distinguishing “good”
 893 from “bad” behavior or participating in efforts to fight “bad” behavior.

894

895 The ideas for active engagement that were discussed by the WG included the following:

896 **[Tentative] the group did not reach consensus on or endorse any of them:**

897

⁶ This list simply captures the ideas that were discussed by the members of the WG, noting arguments either in favor or against an idea only where the WG as a whole achieved rough consensus.

⁷ [A DNS-based system could provide similar of additional data than WHOIS systems do, and at rates higher than many port 43 WHOIS servers currently allow.](#)

Initial Report on Fast Flux Hosting

Authors: TBC

Marika Konings 9/25/08 11:07 AM

Deleted: A DNS-based system could be queried through automation rather than manually. Whois is a manual protocol and not suitable for real time queries

- 898 • Adopt accelerated domain suspension processing in collaboration with certified
899 investigators/responders
- 900 • Establish guidelines for the use of specific techniques, such as very low time-to-live
901 (TTL) values for resource records and limiting the number of modifications to the same A
902 or NS record that can be made within a defined time period, to deter the core fast-flux
903 activities.
- 904 • Identify name servers as static or dynamic in domain registrations by the registrant. If
905 static name servers, the IP addresses used for those name servers should be provided.
906 If dynamic, that's fine, but sites electing to use dynamic name servers should expect that
907 their choice will be taken into account when other sites assess their reputation and
908 decide what (if anything) they want to do with their traffic. Charge a premium for dynamic
909 name server domains.
- 910 • Charge a nominal fee for changes to static name server IP addresses, split between
911 ICANN and the Registry. The funds received from that fee could be dedicated to abuse
912 handling/security-related purposes at ICANN and each Registry.
- 913 • *[Tentative]* Allow the Internet community to mitigate fast-flux hosting in a way similar to
914 how it addresses spam, phishing, Pharming, malware, and other abuses that also take
915 advantage of the DNS and Internet protocols

916

917 *Note: The WG did not answer the following charter-questions due to the lack of:*

- 918 • *A robust technical, and process, definition of "fast flux",*
- 919 • *Reliable techniques to detect fast flux networks while avoiding false positives,*
- 920 • *Reliable information as to the scope and penetration of fast flux networks,*
- 921 • *Reliable information as to the financial and non-financial impact of fast flux*
922 *networks*
- 923 • *An assessment of need, based on the above*
- 924 • *A definition of requirements, or designs, for proposed solutions*

925

926 **5.8 What would be the impact (positive or negative) of establishing limitations,**
927 **guidelines, or restrictions on registrants, registrars and/or registries with**
928 **respect to practices that enable or facilitate fast flux hosting?**

929

930 *[Tentative]* There was support for the following response: Answering this question should
931 be deferred until there is: a robust technical and process definition of "Fast Flux", there are

932 reliable techniques to detect Fast Flux enhanced networks while avoiding false positives.
933 there is reliable information as to the scope and penetration of Fast Flux networks, there is
934 reliable information as to the financial and non-financial impact of these networks, there has
935 been an assessment of need (based on the above) and, the requirements have been
936 defined for proposed solutions.

937

938 **5.9 What would be the impact of these limitations, guidelines, or restrictions to**
939 **product and service innovation?**

940

941 [Tentative] There was support for the following response: Answering this question should
942 be deferred until there is: a robust technical and process definition of "Fast Flux", there are
943 reliable techniques to detect Fast Flux enhanced networks while avoiding false positives.
944 there is reliable information as to the scope and penetration of Fast Flux networks, there is
945 reliable information as to the financial and non-financial impact of these networks, there has
946 been an assessment of need (based on the above) and, the requirements have been
947 defined for proposed solutions.

948

949 **5.10 What are some of the best practices available with regard to protection from**
950 **fast flux?**

951

952

952 **6 [Tentative] Constituency Statements and Other View** 953 **Points**

954 **This section summarizes issues and aspects of fast flux reflected in the statements from the**
955 **GNSO constituencies and individual Working Group members.**

956 **To date, two Constituency statements (Registry Constituency and Non-Commercial Users**
957 **Constituency), one input document (from individual Registrar Constituency members) and**
958 **one initial reaction (Intellectual Property Interests Constituency) have been received. These**
959 **entities are abbreviated in the text as follows (in the order of submission of the constituency**
960 **statements):**

961 **RyC – gTLD Registry Constituency**

962 **IPC – Intellectual Property Interests Constituency**

963 **NCUC – Non-Commercial Users Constituency**

964 **Individual RC members – Individual Registrar Constituency members**

965 **Annex A of this report contains the full text of those constituency statements that have been**
966 **submitted. These should be read in their entirety.**

967 **In addition, a number of individual statements have been submitted which can be found in**
968 **Annex IV of the report.**

969 **While the contributions vary considerably as to themes covered and highlighted, the**
970 **following section attempts to summarize key views on fast flux.**

971 **4.1 Constituency and Other Views**

972 **The RyC, NCUC and a number of individual RC members all recognise that fast flux is being**
973 **used by miscreants involved in online crime to evade detection, but at the same time**
974 **question whether ICANN is the appropriate body to deal with this issue. All three emphasise**
975 **that it is not in ICANN's remit to act as an extension of law enforcement or put registries or**
976 **registrars in this position. At the same time, some members of the Working Group suggest**

984 that ICANN, the registries and registrars are not being asked to act as an extension of law
985 enforcement, but rather to facilitate compliance with existing laws and regulation in those
986 cases where ICANN, the registries and registrars are uniquely situated to do so.
987
988 In addition, the RyC, NCUC and a number individual RC members are concerned that
989 potential solutions for fast flux would prohibit current legitimate uses while at the same time
990 online criminals would simply move on to another technique or method, or would change
991 their implementations to avoid detection or mitigation efforts. The NCUC expresses specific
992 concern in relation to the legitimate use of fast flux in facilitating anonymous speech. The
993 RyC is 'concerned that the cessation of fast-flux could impede the creation of new and
994 legitimate services on the Internet'. Furthermore, the RyC points out that any GNSO policy
995 initiative would have very limited impact as it would "only be applicable to gTLD registries
996 and registrars", while ccTLD domain names are also used for fast flux hosting, which
997 compromise almost half of the domain names on the Internet. ICANN policy could then
998 simply be circumvented by switching to ccTLD domain names. The counter argument from
999 some members of the Working Group is that while the GNSO is not responsible for
1000 administrating ccTLD policy, by showing leadership in administration of gTLD domain
1001 policies (including policies dealing with fast flux), GNSO actions may indirectly influence the
1002 ccTLD policy development process.
1003
1004 The RyC, NCUC and a number of individual RC members all point to the lack of data and
1005 the absence of supporting evidence outlining the scope of fast flux which is a necessity in
1006 order to balance cost – benefits of any potential solutions. The RyC and a number of
1007 individual RC members specifically point to any lack of evidence that "fast flux hosting has
1008 materially impacted the inter-operability, technical reliability and/or operational stability of
1009 Registrar Services, Registry Services, the DNS, or the Internet". At least one participant in
1010 the Working Group notes that substantial data was offered to the Working Group, both with
1011 respect to fast flux usage, and the costs associated with malicious activity facilitated by fast
1012 flux techniques.
1013
1014 The RyC points out that some of the solutions discussed by the Working Group "are
1015 currently impossible, or would require significant revisions to DNS protocols, or would
1016 require significant upgrades in deployed resolver code". Contrary to that perspective,
1017 Working Group members have described how required solutions can be implemented using

1018 [existing record types and the existing/deployed resolver code base, so that protocol changes](#)
1019 [and changes to installed software is not required. See for example](#)
1020 <http://forum.icann.org/lists/qnso-ff-pdp-may08/msg00085.html>

1021
1022 **[4.3 Further Work Suggested by Constituencies](#)**

1023
1024 [The RyC and RC members emphasise the need for further data gathering and analysis](#)
1025 [before any further work is undertaken in this area. Both groups question though whether](#)
1026 [ICANN is the appropriate vehicle to take this discussion further.](#)

1027
1028
1029

1029 7 Challenges

1030 *Note: Despite the fact that the Working Group conducted its work with great enthusiasm*
1031 *and dedication, it encountered a number of stumbling blocks which prevented progress*
1032 *on answering the charter questions and finding a consensus within the group. An*
1033 *overview of the main challenges encountered by the fast flux Working Group is*
1034 *presented below.*

1035

1036 a. Lack of an agreed upon definition of fast flux and supporting data

1037

1038 The issues report and the Working Group charter defined “fast flux” as “rapid and repeated
1039 changes to A and/or NS resource records in a DNS zone, which have the effect of rapidly
1040 changing the location (IP address) to which the domain name of an Internet host (A) or
1041 name server (NS) resolves”. However, the Working Group quickly concluded that this
1042 definition lacked the detail and specificity needed to answer the charter questions. A
1043 substantial amount of time was spent on reworking the definition, which in itself proved to be
1044 a challenge mainly due to difficulties over separating the technical and process elements of
1045 fast flux from the intent and activities for which it is being used. In addition, as outlined
1046 above, the group struggled to come up with a definition that would separate good use of fast
1047 flux from bad use. As a result, the discussion on possible solutions proved to be problematic.
1048 In the absence of an agreed-upon definition of fast flux (and a good assessment of the
1049 extent or impact of the problem) it was not clear what proposed solutions were supposed to
1050 fix.

1051

1052 In a number of instances, the Working Group encountered difficulties in separating between
1053 fast flux as a facilitating technique and the activities it facilitates. This resulted in discussions
1054 that went far beyond the scope and the mandate of the Working Group, as well as ICANN's.
1055 It is worth remembering that in general the WG does not consider fast flux as a distinct fraud
1056 or attack vector comparable to spam, phishing, or malware. The WG feels that the primary
1057 effect of FF when it is used by "bad guys" is to delay the response. That is, FF servers to
1058 prolong the period of time during which the attack continues to be effective, before the
1059 domain is taken down by a "good guy." It is not an attack itself - it is a way for an attacker to
1060 frustrate the response to the attack.

1061

1062 The lack of data and lack of understanding of the full scope of fast flux also made
1063 discussions difficult. Working Group members for the most part agree that further fact finding
1064 and data gathering is imperative in order to have an informed discussion on this subject.
1065 However, the members do not agree as to whether ICANN is the best organization to
1066 conduct this activity. This point is expanded on in the next section of the report.

1067
1068 Lack of a clear definition and disagreement on the exact scope of the problem made it
1069 extremely difficult to continue discussions as participants were speaking on the basis of
1070 different assumptions and different expectations as to what a potential recommendation on
1071 fast flux should look like.

1072
1073 The question was asked whether a PDP was started prematurely. The March 2008 Issues
1074 Report had already recommended that further fact-finding and research would be helpful in
1075 order to inform the community's deliberations.

1076

1077 **b. Misconception about the scope of a PDP and remit of ICANN**

1078

1079 **[Tentative] [Placeholder: Include information on Affiliars Abuse Funnel Request document**
1080 **which received agreement from the WG (proposal 41)]**

1081

1082 As mentioned under point a, one could consider that a PDP on fast flux was premature as
1083 there was not sufficient information available to inform the debate or agreement on the exact
1084 scope and nature of fast flux. In addition, neither the GNSO Council nor the charter identified
1085 what the objective of a potential recommendation on fast flux should be.

1086

1087 The format of a Working Group that was chosen for this PDP also caused some issues.
1088 Various participants that had not previously participated in ICANN policy development were
1089 part of the group, which is to be welcomed as it brought new expertise and important views
1090 to the table. However, with perfect hindsight it is clear that the process should have included
1091 a period of briefings and familiarization where all participants could have been made aware
1092 of the constraints and limitations of the PDP process.

1093

1094 In addition, many felt that the charter did not provide sufficient information on what was
1095 expected to be delivered by the Working Group nor were important questions included. The

1096 group struggled with finding the right balance between respecting the charter, the lack of
1097 information and the need to find a solution and consensus.

1098

1099 Although the issues report clearly stated that “the overall question of how to mitigate the use
1100 of fast flux hosting for cybercrime is broader than the GNSO policy development process”,
1101 some members of the Working Group had difficulty in accepting this limitation. As a result,
1102 discussions started focussing on how to fight cybercrime, including spam and phishing,
1103 instead of looking at the narrower question of fast flux as it pertains to ICANN
1104 constituencies. As some participants pointed out, some of the discussions and proposed
1105 actions would be more appropriate for bodies like the Anti-Phishing Working Group (APWG)
1106 than ICANN taking into account its current remit.

1107

1108

1108 8 Conclusions and Possible Next Steps

1109 *[Tentative] During the study of fast flux hosting, the working group quickly came to*
1110 *appreciate that the subject area that originally formed the basis of the study had changed*
1111 *rapidly in the from the time of publication of the SSAC report that stimulated GNSO interest*
1112 *to the issuance of the PDP. Flux hosting, flux techniques and flux facilitated attacks*
1113 *continued to evolve even during the WG's study period. This section attempts to draw*
1114 *conclusions from a study that can in some respect be characterized as having placed the*
1115 *WG in the losing end of a race condition: simply put, the WG was at a disadvantage having*
1116 *been assigned the task of studying a moving target.*

1117

1118 8.1 Conclusions

1119

1120 *Fast flux hosting has numerous applications. Some experts have focused on the*
1121 *applications of fast flux hosting that are self-beneficial but publicly detrimental and consider it*
1122 *to be an effective technique for keeping fraudulent sites active on the Internet for the longest*
1123 *period of time, and it requires domain registrations as a component for success. At the same*
1124 *time, a number of many of the characteristics that experts ascribe to fast flux hosting have*
1125 *been identified as self-beneficial without being harmful to others, or indeed, both self- and*
1126 *publicly beneficial. In these latter applications, the goals of fast flux hosting are to make*
1127 *networks survivable or highly reliable, but the motives are quite different.*

1128

1129 *Gaining a common appreciation and broad understanding of the motivations behind the*
1130 *employment of fast flux or adaptive networking techniques proved to be a particularly thorny*
1131 *problem for the WG. Attempts to associate an intent other than criminal and characterizing*
1132 *fast flux hosting as legitimate or illegal, good or bad, stimulated considerable debate, as*
1133 *such labels are highly subjective in certain situations.*

1134

1135 *Study by members of the WG also revealed that flux hosting is necessarily, accurately*
1136 *characterized as "fast flux" but more generally, that flux hosting encompasses several*
1137 *variations and adaptations of event-sensitive, responsive, or volatile networking techniques.*
1138 *The WG studied many of the methods of detecting fast flux activities and thwarting fast flux*
1139 *hosting required participation and intervention. The WG also studied whether certain data*
1140 *could be monitored, collected, and made available by various parties (e.g., registries).*

1141 registrars, and ISPs) to facilitate detection and intervention in circumstances where fast flux
1142 hosting was publicly detrimental. These studies merit further attention, particularly in areas
1143 where an unacceptable level of false positives would prove detrimental to registrants
1144 affected by intervention and where measures are needed to ensure that parties reporting
1145 fast flux activity are provably trustworthy.

1146
1147 The WG also acknowledges that fast flux and similar techniques are merely components in
1148 the larger issue of internet fraud and abuse. The techniques described in this report (and
1149 others yet to be revealed) are only part of a vast and constantly evolving toolkit for attackers.
1150 None of the techniques are necessary to the degree that mitigating any one would eliminate
1151 internet fraud and abuse. Every attack that is enhanced by the use of one or more fast flux
1152 techniques could be pursued without them, possibly at higher cost or effort for the attacker.
1153
1154 These various and highly interrelated issues must all be taken into account in any potential
1155 policy development process and/or next steps. Careful consideration will need to be given as
1156 to which role ICANN can and should play in this process.

1158 8.2 Possible next steps

1159
1160 *Note: The Working Group proposes the following options for next steps to address*
1161 *the issues and challenges outlined in this report. Please note that the WG was not*
1162 *able to reach consensus around all of these choices.*

1164 8.2.1 Problem statement

- 1166 • Option P1 – Continue to focus on Fast Flux, a rapidly-emerging technique (that relies on
1167 Internet names and numbers) which is used to harden malicious networks

1168
1169 *NOTE: The group has formed a rough consensus around recommending this*
1170 *narrower focus. However there are strong arguments to be made that Fast Flux is*
1171 *merely an example of a technique that leverages Internet names and numbers to*
1172 *harden networks used for fraud and abuse and that the broader view would lead to a*
1173 *more effective response.*

Marika Konings 10/13/08 12:19 PM

Deleted: Fast flux is considered by some experts to be an effective technique for keeping fraudulent sites active on the Internet for the longest period of time, and it requires domain registrations as a component for success. At the same time a number of legitimate uses of similar techniques have been identified that need to be taken into account in any potential policy development process and/or next steps. Careful consideration will need to be given as to which role ICANN can and should play in this process, as fast flux (the technique) is only one component in the larger issue of internet fraud and abuse. In addition, it should not be forgotten that fast flux techniques (including short TTLs and rapidly changing A and NS records) are convenient tools for attackers, but they are not necessary - every attack that is enhanced by the use of one or more fast flux techniques could be pursued without them, albeit at higher cost or effort for the attacker.

- 1175 • Option P2 – Explore a broader issue; how Internet names and numbers are used to
1176 enable Internet fraud and abuse, and the role of the ICANN community in addressing this
1177 problem
1178

1179 8.2.2 Scope

1180

- 1181 • Option S1 – Assess need
- 1182 ○ Develop process and technical definitions of the “problem” selected from above
 - 1183 ○ Develop algorithms that can be used to detect the “problem” with safeguards to
1184 minimize false positives
 - 1185 ○ Identify and recruit partners who can provide data for analysis and tools to
1186 analyze that data
 - 1187 ○ Develop data that quantifies;
 - 1188 ■ The quantity and trends of the “problem”
 - 1189 ■ In the case of Fast Flux, determine the proportion of fraud/abuse attacks
1190 that utilize the technique
 - 1191 ■ In the case of Fast Flux, determine the quantifiable financial and non-
1192 financial impacts of Fast Flux extrapolated from the proportions above
 - 1193 ○ Develop a financial and operational justification for any further steps
 - 1194 ○ Develop a charter for the next phase of the effort
 - 1195 ○ Conduct a formal PDP to accept the results and make a go/no-go decision on the
1196 next phase
1197

1198 *NOTE: There is rough consensus among the Working Group that this is the*
1199 *appropriate next step, and that the scope of the effort should be limited to this*
1200 *“Assess Need” task.*
1201

- 1202 • Option S2 – Also include a phase to define solutions and requirements based on the
1203 needs identified in Phase I
1204

1205 *NOTE: Examples of “Solutions” described in this phase could include: policy*
1206 *changes, pricing changes, process changes, protocol changes, software tools,*
1207 *information-sharing collaborations, collaborations with certified*
1208 *investigators/responders or something else. The working group has formed a rough*

1209 *consensus that any “solution” proposal must be underpinned by a robust justification,*
1210 *based on facts developed during the Assess Need phase of the work.*

1211

- 1212 • Option S3 – Also include a phase to design, build and test solutions

1213

- 1214 • Option S4 – Also include a phase to deploy solutions

1215

1216 *NOTE: Much of the difficulty encountered by the Working Group was due to the*
1217 *desire by some members to jump directly to this phase, while other members were*
1218 *still trying to develop the underpinnings to justify that move.*

1219

1220 **8.2.3 Stakeholders**

1221

- 1222 • Option ST1 – GNSO, ccNSO and ALAC to participate in the effort

1223

1224 *NOTE: There is rough consensus that these Supporting Organizations need to be*
1225 *included in subsequent work*

1226

- 1227 • Option ST2 – Also include the ASO, IETF and GAC

1228

- 1229 • Option ST3 – Also include stakeholders external to ICANN (examples include: APWG,
1230 MAAWG, CCERT, FIRST, Artists Against 419.org, StopBadware.org, Regulatory
1231 enforcement agencies such as the FTC, Law enforcement).

1232

1233 **8.2.4 Champion**

1234

- 1235 • Option C1 – If the problem-statement remains focused on Fast Flux, GNSO should
1236 champion the effort
- 1237 • Option C2 – If the problem-statement is the broader “fraud and abuse” question, the
1238 ICANN Board should champion the effort.

1239

1240 *NOTE: There is rough consensus around these choices of “champion”*

1241

1242 **8.2.5 Approach**

1243

- 1244 • Option A1 – Use a “project” approach that is less focused on pure policy-making than the
1245 PDP Working Group process.

1246

1247 *NOTE: There is a weak rough consensus around this choice of “approach”*

1248

- 1249 • Option A2 – Include a “ratify the results” PDP at the end of the phase to provide a
1250 connection back to the policy-making process.

1251

1252 *NOTE: There is a weak rough consensus around this refinement of the approach*

1253

- 1254 • Option A3 – Continue to use the GNSO PDP process.

1255

1256

1257 **8.2.6 Readiness**

1258

- 1259 • Question – “Does this project need to happen?”

1260

1261 *NOTE: There is not consensus that a followup effort should happen – the group is*
1262 *about evenly divided on this.*

1263

- 1264 • Question – “Should ICANN take the lead?”

1265

1266 *NOTE: There is not consensus that ICANN is the appropriate organization to be*
1267 *taking the lead on either of these issues. Again, the group is about evenly divided.*
1268 *The following suggestions came from those who felt that ICANN is not the*
1269 *appropriate lead – Law enforcement, security vendors, governments and APWG.*

1270

1271 **8.2.6 Resources**

1272

- 1273 • Question – “What type of people would need to be involved?”

1274

1275 *NOTE: This is an undifferentiated list, polled from the working group. The group that*
1276 *charters the next effort should view this merely as a suggestion of possibilities and*

1277 *refine the list as needed. Suggestions include; law enforcement, governments,*
1278 *researchers, anti-crime/anti-fraud organizations, policy developers, project*
1279 *managers, consumer stakeholders, data & risk analysts, Internet experts, rights-*
1280 *protection experts.*

1281

1282 • Question – “What’s your best guess as to the elapsed time this project would take, in
1283 weeks?”

1284

1285 *NOTE: Responses ranged from 12 to 104 weeks with predominance around 16-26*
1286 *weeks. The Chair takes the liberty of strongly suggesting that elapsed-time*
1287 *estimates be deferred until the chartering choices have been made, and detailed*
1288 *work-plans developed.*

1289

1290

1291

1292

1292 **Annex I – First-round Constituency Input Template**

1293 **Constituency Input Template**

1294

1295 The GNSO Council has formed a Working Group of interested stakeholders and
1296 Constituency representatives, to collaborate broadly with knowledgeable individuals and
1297 organizations, in order to develop potential policy options to curtail the criminal use of fast
1298 flux hosting.

1299

1300 An early part of the working group's effort will incorporate ideas and suggestions gathered
1301 from Constituencies. View this as a brainstorming effort, rather than a formal policy-
1302 comment process (a formal Constituency Statement process is scheduled to start about a
1303 month from now). Our goal at this stage is to allow very broad participation in our drafting
1304 effort. So there is no requirement that your Constituency provide any suggestions at this
1305 time -- but any ideas are welcome.

1306

1307 Inserting your Constituency's response in this form will make it much easier for the Working
1308 Group to summarize the Constituency responses. This information is helpful to the
1309 community in understanding the points of view of various stakeholders.

1310

1311 **Process:**

1312

- 1313 • Please identify the members of your constituency who participated in developing the
1314 perspective(s) set forth below.
- 1315 • Please describe the process by which your constituency arrived at the perspective(s) set
1316 forth below.

1317

1318 **Questions:**

1319

- 1320 1. Who benefits from fast flux, and who is harmed?
- 1321 2. Who would benefit from cessation of the practice and who would be harmed?
- 1322 3. Are registry operators involved, or could they be, in fast flux hosting activities? If so,
1323 how?
- 1324 4. Are registrars involved in fast flux hosting activities? If so, how?

- 1325 5. How are registrants affected by fast flux hosting?
1326 6. How are Internet users affected by fast flux hosting?
1327 7. What technical, e.g. changes to the way in which DNS updates operate, and policy, e.g.
1328 changes to registry/registrar agreements or rules governing permissible registrant
1329 behavior measures could be implemented by registries and registrars to mitigate the
1330 negative effects of fast flux?
1331 8. What would be the impact (positive or negative) of establishing limitations, guidelines, or
1332 restrictions on registrants, registrars and/or registries with respect to practices that
1333 enable or facilitate fast flux hosting? What would be the impact of these limitations,
1334 guidelines, or restrictions to product and service innovation?
1335 9. What are some of the best practices available with regard to protection from fast flux?
1336 10. Which areas of fast flux are in scope and out of scope for GNSO policy making.
1337

1338 **Note:**
1339

- 1340 • Consensus is not required at this stage of the process. If ideas differ within the
1341 Constituency, please provide all of them. The working group will work to resolve the
1342 differences and the Constituency will have an opportunity to comment in the formal
1343 Constituency Statement process.

1344

1345 **Annex II - Constituency Input**1346 *Version August 7, 2008*

1347

1348

Registry Constituency Input Template:

1349

Fast-Flux Working Group

1350

1351 *The GNSO Council has formed a Working Group of interested stakeholders and*
1352 *Constituency representatives, to collaborate broadly with knowledgeable individuals and*
1353 *organizations, in order to develop potential policy options to curtail the criminal use of fast*
1354 *flux hosting.*

1355

1356 *An early part of the working group's effort will incorporate ideas and suggestions gathered*
1357 *from Constituencies. View this as a brainstorming effort, rather than a formal policy-*
1358 *comment process (a formal Constituency Statement process is scheduled to start about a*
1359 *month from now). Our goal at this stage is to allow very broad participation in our drafting*
1360 *effort. So there is no requirement that your Constituency provide any suggestions at this*
1361 *time -- but any ideas are welcome.*

1362

1363 *Inserting your Constituency's response in this form will make it much easier for the Working*
1364 *Group to summarize the Constituency responses. This information is helpful to the*
1365 *community in understanding the points of view of various stakeholders.*

1366 *Please identify the members of your constituency who participated in developing the*
1367 *perspective(s) set forth below:*

1368

1369 *Voting in favor of this document, in full (listed alphabetically by TLD): NeuStar (.BIZ),*
1370 *puntCAT (.CAT), VeriSign (.COM, .NET), DotCooperation LLC (.COOP), Afiliias (.INFO),*
1371 *Employ Media (.JOBS), mTLD (.MOBI), Global Name Registry (.NAME), Public Interest*
1372 *Registry (.ORG), RegistryPro (.PRO). Voting against: none. Abstaining: none. Absent/no*
1373 *response: SITA (.AERO), dotAsia Organisation (.ASIA), MuseDoma (.MUSEUM), TeINIC*
1374 *(.TEL), Tralliance Corp. (.TRAVEL).*

1375

1376 *Please describe the process by which your constituency arrived at the perspective(s) set*
1377 *forth below:*

1378

1379 Based upon discussion of the issues, Registry Constituency members created a draft
1380 document, which was then circulated amongst all Constituency members for rounds of
1381 discussion and editing. Further discussion took place in two constituency teleconferences.
1382 After several iterations, a final draft was voted upon.

1383 *NOTE: Consensus is not required at this stage of the process. If ideas differ within the Constituency, please*
1384 *provide all of them. The working group will work to resolve the differences and the Constituency will have an*
1385 *opportunity to comment in the formal Constituency Statement process.*

1386

1387 **Executive Summary:**

1388

1389 The Registry Constituency recognizes that fast-flux hosting is used by criminals to
1390 perpetrate a variety of illegal activities, which harm a variety of parties including registry
1391 operators. Constituency supports further discussion of voluntary best practices that would
1392 facilitate data sharing and are designed to identify problematic domain names.

1393

1394 The Registry Constituency feels that key issues are outside of ICANN's purview, and beyond
1395 the scope of GNSO policy-making:

1396

1397 1. ICANN's purview with regard to making policy to mitigate criminal use of the DNS is very
1398 limited, and technical. At the core, combating fast-flux hosting is a matter of identifying and
1399 disabling domains that are being used for illegal purposes.

1400

1401 2. It is not within ICANN's purview to place gTLD registries in a position to become
1402 extensions of law enforcement regimes around the world, by requiring registries to take
1403 action against a domain name that may be in violation of one or more nation's laws. In
1404 addition, it is not within ICANN's purview to determine (or license another evaluative body to
1405 determine) which domain names are being used for illegal purposes.

1406

1407 3. To require registries to act against certain domain names may also expose registries to
1408 unknown liabilities, and it is not clear whether ICANN has an effective ability to protect
1409 contracting parties from these liabilities.

1410

1411 4. Contracted parties should have the ability to set relevant terms of service for their
1412 respective TLDs or registrar service, as applicable. Various parties already have the ability

1413 to act against problematic domain names, according to their various contracts and terms of
1414 service. Models for this activity already exist in directly relevant areas, and fast-flux domains
1415 are already being taken down. Every day, members of the Internet community – including
1416 hosting providers, network operators, registrars, registries, businesses and intellectual
1417 property owners, and law enforcement bodies—deal with domain names used for phishing,
1418 spam, malware, and other problems. Such problems have been resolved without involving
1419 ICANN, and we believe that most proposed solutions to deal with fast-flux hosting should not
1420 involve ICANN intervention.

1421

1422 5. There are venues for dealing with criminal activity, but ICANN is not such a venue.
1423 Criminals adapt their tactics quickly, and the parties taking action against them should be
1424 free to craft their own solutions as conditions suggest.

1425

1426 6. We do not believe that the Working Group has yet demonstrated, from a technical
1427 standpoint, that fast-flux hosting has materially impacted the interoperability, technical
1428 reliability, and/or operational stability of Registrar Services, Registry Services, the DNS, or
1429 the Internet. These continue to function well.

1430

1431 7. We believe that as of the date of this statement, the Working Group has not adequately
1432 quantified the scope of the problem based upon data. It is therefore difficult to evaluate the
1433 costs/benefits of solutions.

1434

1435 The Registry Constituency also explains below why it feels that some proposed solutions:

1436

1437 1. Are technically and legally outside the power of registries to implement,

1438

1439 2. Present significant engineering issues that could require revisions to protocols and the
1440 DNS itself,

1441

1442 3. Are not relevant to some registries, and

1443

1444 4. Could negatively impact various parties, some of which may be using fast-flux techniques
1445 for legitimate purposes.

1446

1447 Questions:

1448

1449 1. Who benefits from fast flux, and who is harmed?

1450 Phishing, pharming, spam, and other illegal activities that may be perpetrated through the
1451 use of fast-flux networks represent a well-known threat to the security of Internet users.
1452 These types of domain name abuses can also harm the reputations and brands of specific
1453 TLDs. TLDs can be saddled with negative reputations for higher-than-average abuse rates.
1454 Some registries have adopted voluntary means to help address these issues. Most registries
1455 have no direct relationship with the registrants responsible for the abusive behavior.

1456

1457 2. Who would benefit from cessation of the practice and who would be harmed?

1458

1459 We will use the definitions found in the GNSO Issues Report on Fast Flux Hosting, which
1460 are:

1461

1462 **Fast Flux:** In this context, the term “fast flux” refers to rapid and repeated changes to A
1463 and/or NS resource records in a DNS zone, which have the effect of rapidly changing the
1464 location (IP address) to which the domain name of an Internet host (A) or name server (NS)
1465 resolves.

1466 **Fast Flux Hosting:** The practice of using fast flux techniques to disguise the location of web
1467 sites or other Internet services that host illegal activities.

1468

1469 Using these definitions, “fast flux” is a technique or technical implementation, while “fast flux
1470 hosting” is the use of the technique for criminal purposes.

1471 We are concerned that solutions aimed at certain types of nefarious activities criminal
1472 activity could prohibit or constrain legitimate activities that uses similar techniques, or might
1473 not accurately interpret the intent of the activity. It may be difficult to distinguish some
1474 criminal uses from non-criminal uses, especially using technical means only.

1475 We are also concerned that cessation of fast-flux could impede the creation of new and
1476 legitimate services on the Internet, and we would like to know whether the cessation of fast-
1477 flux would impact any existing services, for example commercial services or services that
1478 facilitate speech on the Internet. As noted in its bylaws, one of ICANN’s core values is
1479 “Respecting the creativity, innovation, and flow of information made possible by the Internet.”

1480

**1481 3. Are registry operators involved, or could they be, in fast flux hosting activities? If
1482 so, how?**

1483 Some TLDs probably have never had domains that operate on fast-flux networks, and are
1484 less vulnerable. Fast-flux domains used for nefarious purposes are registered by criminals,
1485 who may not have easy access to domains in certain sTLDs. Some solutions might therefore
1486 not be good fits for all registries, and voluntary participation to best practices and/or specific
1487 programs might therefore be more viable.

1488

1489 Fast-flux hosting can be addressed if the domain names involved are not allowed to resolve.
1490 Domain names are stopped from resolving by removing them from the zone (by placing an
1491 EPP HOLD status, or removing the associated nameservers from the domain record, or by
1492 deleting the name from the registry.) Two parties have the technical ability to remove a
1493 domain name from the TLD zone – the sponsoring registrar, or the registry operator.
1494 (Registrants and resellers act through a registrar's system.) The relevant hosting provider(s)
1495 also have the ability to stop a domain name from functioning, by making changes at the
1496 nameservers.

1497

1498 ICANN's agreements with gTLD registry operators give registry operators varying rights to
1499 suspend domain names. Registrars, on the other hand, have direct contractual relationships
1500 with their registrants, and are often in a better position to communicate directly with their
1501 customers. (See Question #4 below for more.) Therefore, registries have often adopted
1502 practices to present abuse reports to the registrar of record.

1503 As per its bylaws, the mission of ICANN is to “coordinate, at the overall level, the global
1504 Internet's systems of unique identifiers, and in particular to ensure the stable and secure
1505 operation of the Internet's unique identifier systems,” and ICANN “coordinates policy
1506 development reasonably and appropriately related to these technical functions.” We do not
1507 think that making policy to mitigate criminal use of fast-flux hosting is reasonably and
1508 appropriately related to ICANN's technical functions. At the core, combating fast-flux hosting
1509 is a matter of identifying and disabling domains that are being used for illegal purposes.

1510 It is not within ICANN's purview to require registries to become an arm of a law enforcement
1511 regime, nor to act on every allegation that may be made about purported illegal uses of
1512 domain names. It is not within ICANN's purview to determine (or license another evaluative
1513 body to determine), which domain names are being used for illegal purposes. To require
1514 registries to act against certain domain names may also expose registries to unknown
1515 liabilities, and it is not clear whether ICANN has an effective ability to protect contracting
1516 parties from these liabilities.

1517

1518 The GNSO Issues Report on Fast Flux Hosting stated: “The community of researchers,
1519 system administrators, law enforcement officials, and consumer advocates who are fighting
1520 Internet scams that are enabled or accelerated by fast flux hosting have concluded that
1521 trying to thwart fast flux hosting by detecting and dismantling the botnets (fast flux service
1522 networks) is not effective.” We agree. However, the Issues Report then went on to say:
1523 “Other measures that require the cooperation of DNS registries and registrars to identify or
1524 defeat fast flux techniques are expected to be much more effective.” And that “ICANN Staff
1525 research has confirmed that fast flux hosting.... could be significantly curtailed by changes in
1526 the way in which DNS registries and registrars currently operate.” (page 10)

1527

1528 We believe that those statements, especially relating to registries, are overbroad and need
1529 careful examination. Some of the proposed solutions involving registries are impossible for
1530 registries to implement, or will be ineffective for technical reasons. For example, registries
1531 have no role in how many fast-flux networks operate, registries are not necessarily privileged
1532 in their ability to detect fast-flux domains, and registries have differing abilities to act directly
1533 against abusive uses of domain names.

1534 Please see response to Question 7 below for more commentary on technical and policy
1535 solutions that may involve registries. The Registry Constituency is interested in addressing,
1536 with the wider community, the problems caused by fast-flux hosting.

1537

1538 **4. Are registrars involved in fast flux hosting activities? If so, how?**

1539

1540 Fast-flux hosting can be addressed if the domain names involved are not allowed to resolve.
1541 As far as we are aware, all ICANN-accredited registrars have registrar-registrant contracts
1542 and terms of service that prohibit registrants from using their domain names for illegal or
1543 abusive purposes. These contracts allow registrars to variously suspend such domain
1544 names (i.e., stop them from resolving), delete them, and/or cancel the registrant’s rights
1545 and/or control over the domain. The agreements usually require the registrants to indemnify
1546 the registrars as well. Registrars are free to enforce their terms of service, and exercise
1547 these rights regularly by suspending many gTLD domain names each day for spam,
1548 phishing, malware distribution, the distribution of child pornography, and other abuses.

1549

1550 **5. How are registrants affected by fast flux hosting?**

1551

1552 **6. How are Internet users affected by fast flux hosting?**

1553

1554 **7. What technical, e.g. changes to the way in which DNS updates operate, and policy,**
1555 **e.g. changes to registry/registrar agreements or rules governing permissible**
1556 **registrant behavior measures could be implemented by registries and registrars to**
1557 **mitigate the negative effects of fast flux?**

1558

1559 It is important to understand the technical means available to TLD registries, including the
1560 relevant Internet specifications and protocols. Unfortunately, some proposed solutions to
1561 fast-flux hosting that involve registries are currently impossible, or would require significant
1562 revisions to DNS protocols, or would require significant upgrades in deployed resolver code.
1563 Other proposed solutions may have limited impact, or are not exclusive to registries only.

1564

1565 Beyond the technical issues, some proposed solutions would require wide-ranging changes
1566 to registration paradigms, registrant behavior, and registry business practices. These should
1567 be examined carefully. In all cases the benefits should be proven to outweigh the costs, and
1568 registries should be given the means to recover the costs associated with any solutions
1569 imposed upon them.

1570

1571 Network operators, businesses, hosting providers, government organizations, intellectual
1572 property owners, registries, and registrars all have roles to play when addressing various
1573 Internet abuses, and collaborative solutions and data sharing may be useful.

1574 Below are some assumptions and proposals about how registries may be involved in fast-
1575 flux hosting:

1576

1577 The GNSO Issues Report on Fast Flux Hosting [[http://gnso.icann.org/issues/fast-flux-
1578 hosting/gnso-issues-report-fast-flux-25mar08.pdf](http://gnso.icann.org/issues/fast-flux-hosting/gnso-issues-report-fast-flux-25mar08.pdf)] stated:

1579 Registries and registrars can curb the practice in two ways: (1) by monitoring DNS activity
1580 (fast flux is easy to detect) and reporting suspicious behavior to law enforcement or other
1581 appropriate reporting mechanism; and (2) by adopting measures that make fast flux either
1582 harder to perform or unattractive.

1583

1584 Some possible measures that have been suggested include:

- 1585 • authenticating contacts before permitting changes to NS records;
1586 • preventing automated NS record changes;
1587 • enforcing a minimum “time to live” (TTL) for name server query responses; Fast-Flux
1588 Working Group: Registry Constituency Input Template - August 7, 2008 6
1589 • limiting the number of name servers that can be defined for a given domain; and
1590 • limiting the number of address record (A) changes that can be made within a specified time
1591 interval to the name servers associated with a registered domain.
1592 (page 11)

1593

1594 The SSAC Advisory on Fast Flux Hosting and DNS

1595 [<http://www.icann.org/en/committees/security/sac025.pdf>] identified the following potential
1596 solutions that could possibly involve registries:

- 1597 • Adopting procedures that accelerate the suspension of a domain name,
1598 • Remove domains used in fast flux hosting from service
1599 • Authenticate contacts before permitting changes to name server configurations.
1600 • Implement measures to prevent automated (scripted) changes to name server
1601 configurations.
1602 • Set a minimum allowed TTL (e.g., 30 minutes) that is long enough to thwart the double
1603 flux element of fast flux hosting.
1604 • Separate "short TTL updates" from normal registration change processing.
1605 • Implement or expand abuse monitoring systems to report excessive DNS configuration
1606 changes.
1607 • Publish and enforce a Universal Terms of Service agreement that prohibits the use of a
1608 registered domain and hosting services (DNS, web, mail) to abet illegal or objectionable
1609 activities (as enumerated in the agreement).
1610 • Rate-limit or (limit by number per hour/day/week) changes to name servers associated
1611 with a registered domain name.

1612

1613 Below we will examine these ideas and others; we find many of them problematic.

1614

1615 ***Do registries have any control over fast-flux networks?***

1616

1617 Single-flux fast-flux networks do not involve changes to records in a TLD registry. Single-flux
1618 service networks change A records for their front-end node IP address. This happens at a
1619 level below the registry.

1620

1621 Therefore, registries and registrars have no control over single-flux networks. No registry
1622 records are changed, and registries cannot monitor or detect that change activity via registry
1623 data. A great deal of fast-flux hosting takes place on single-flux networks.

1624

1625 Double-flux fast-flux networks do involve changes to records in a TLD registry. Double-flux is
1626 where both the NS records (authoritative name server for the domain) and A records (Web
1627 serving host or hosts for the target) are regularly changed, making the fast-flux service
1628 network more dynamic. For double-flux techniques to work, the registrant must frequently
1629 change the NS information at the registry.

1630

1631 Registries could analyze registry records to find nameserver changes, but would have to
1632 couple them with a single-flux detection method in order to be meaningful.

1633

1634 We see the following additional issues:

1635

1636 1. Problematic changes (i.e., those done for criminal intent) must be distinguished from non-
1637 problematic updates. This is a non-trivial matter in a registry of any size. Domain name
1638 registries are not in a position to interpret what does or does not constitute criminal activity in
1639 every legal jurisdiction in the world.

1640

1641 2. There is some evidence that some operators of double-flux networks change their
1642 nameserver records only on an infrequent basis. In some observed cases the interval
1643 between changes is days or even weeks. Such change rates do not qualify as rapid, and
1644 some so-called double-flux networks might not be worthy of the name.

1645

1646 3. There are many legitimate reasons why a registrant would want to change nameserver
1647 records more than twice or three times in the course of a month. Restrictions on change
1648 rates at such levels would unnecessarily restrict normal operations and user freedom.

1649

1650 4. Changes at the TLD level are detectable to anyone analyzing the TLD zone files, which
1651 are available daily free of charge.

1652

1653 5. Since changes to TLD records are relatively easy for the registry operator and other
1654 observers to detect, they might not be attractive methods for criminals.

1655

1656 6. By themselves, registry records give an incomplete picture in other ways. Registry
1657 operators cannot see some hosting-related changes because they involve changes to
1658 registry records in other TLDs. A registry's records can reveal when the IP of a nameserver
1659 object is changed – but only if the nameserver exists on a domain in that TLD. For example,
1660 the nameserver ns1.example.com exists as a record in the .COM registry, and that
1661 nameserver record must have an IP address associated with it, because the .COM registry
1662 is authoritative for .COM objects. The nameserver ns1.example.com may also exist as an
1663 object in the .ORG registry as well. However, that nameserver record in the .ORG registry
1664 cannot have an IP address associated with it, because the .COM registry is authoritative for
1665 .COM objects. This means that the .ORG registry operator cannot use its registry records to
1666 see if the IP of ns1.example.com is changing.

1667

1668 There is a need for more data to understand how many fast-flux networks operate on single
1669 flux versus double flux, at what rates double flux networks change their nameserver records
1670 in registries, and how frequent such changes need to be in order for a network to be
1671 considered a double-flux network. At this time there is not enough data to establish the
1672 scope of the problem.

1673

1674 ***Are registries in a special position to detect fast-flux hosting?***

1675

1676 No. Fast-flux hosting is most commonly detected by querying nameservers for A records
1677 and recording the changes to those records over time. This method requires basic tools, and
1678 is currently practiced by many entities, including security companies, network operators, and
1679 academic researchers. Most subscribe to the gTLD zone files, which ICANN requires the
1680 registries to make available free of charge.

1681

1682 Some registry operators may be able to analyze DNS query data that comes to the TLD
1683 servers. This data is voluminous in larger TLDs, and is harder to interpret.

1684

1685 ***Is fast-flux hosting easy to detect, or easy to positively identify? Is it easy to identify***
1686 ***criminal behavior?***

1687

1688 The answers to all these questions is “no.” While it is easy to compile query data in the way
1689 described above, that data must then be interpreted. The key concept is that the observer
1690 must be able to separate out criminal uses of the fast flux technique from non-criminal uses,
1691 and in some cases this can be very difficult.

1692

1693 Some believe that fast flux hosting can easily be identified on an automated basis. But
1694 automated checking is not accurate when determining the criminal intent of any particular
1695 implementation. Rather, it may be possible for a certain percentage of criminal fast-flux
1696 hosting to be identified to a high degree of accuracy. This means that some criminal fast-flux
1697 hosting may be overlooked or discarded because it does not pass enough “tests” of bad
1698 intent, that manual checking is advisable, and that false positives will probably never be
1699 eliminated.

1700

1701 These problems are important, because the ultimate goal may be to suspend the resolution
1702 of fast-flux domain names. Parties who suspend domain names must perform due diligence,
1703 and are exposed to liability.

1704

1705 The Working Group has also examined case studies that demonstrate that:

1706

1707 1. fast-flux detection systems create false-positives.

1708

1709 2. It is not always possible to determine the intent that some fast-flux domains are being
1710 used for.

1711

1712 3. It is not always possible to determine whether the hosts involved are compromised.

1713

1714 Improved information availability may be useful for combating fast flux, but will result in
1715 incremental improvements only, just as blacklists and antivirus products have produced
1716 incremental progress against spam, phishing, and malware.

1717

1718 ***Can TLD registries control TTL values?***

1719

1720 No, not in a way that is meaningful to this problem. Practically, domain name users and their
1721 hosting providers are in control of the TTLs related to their domain names, and are free to
1722 set whatever TTL they like.

1723

1724 Registrars have no mechanism by which they can set the TTL on records in the parent zone
1725 for domains they register, and registrars do not set or populate the time-to-live (TTL) for the
1726 resource records found in TLD zone files.

1727

1728 TLD registries may set a default TTL value. However, this TTL value is a default value only
1729 and does not control the actual TTLs associated with names in the zone. Instead, a TTL is
1730 set by the authoritative nameserver for a particular resource record. The authoritative data
1731 for a zone is below the zone cut, and any registry operator has a limited to no influence on
1732 the TTL on a delegation.

1733

1734 For example, any long TTL specified in the .COM zone in the NS set for a domain would be
1735 overwritten in resolvers' caches by the TTL specified in the daughter zone, which the registry
1736 does not host. So if the .COM registry operator sets a TTL of 600 minutes, and whoever
1737 hosts the individual domain name sets a TTL of 3 seconds, what gets cached is 3 seconds.

1738

1739 So, this default TTL has no practical impact on fast-flux hosting, because domain name
1740 registrants and their hosting providers are ultimately in control of the authoritative TTLs, and
1741 are free to set whatever TTL they like. This user-set value is the TTL value that prevails on
1742 the Internet, and this is a current, designed feature of the DNS. We do not know of any
1743 mechanism by which ICANN could limit the TTLs that zone administrators decide to install
1744 on their own RRsets.

1745

1746 Note that the EPP registry-registrar protocol offers no mechanism for registrars to specify
1747 TTL values to the registry.

1748

1749 What are the effects of either short or long TTLs on NS sets above the zone cut for queries
1750 which follow those delegations? This is not well understood. It is not known, for example, if
1751 increasing the TTL on NS sets in TLD zones could have an effect on some caches across

1752 the Internet. Before ICANN makes any related policy, we would expect ICANN to
1753 commission a credible technical study, and there should be significant input from the IETF.
1754 Any proposed changes to the DNS protocols, or to their standard implementations, should
1755 have the support of the engineering community, and such discussions should involve a
1756 formal consultative process with the IETF.

1757

1758 ***Are there legitimate uses for short TTLs?***

1759 Yes. Any entity that operates a Web site or other Internet service has legitimate reasons for
1760 using short TTLs, at least for finite periods of time. Such uses are written into relevant RFCs,
1761 including the domain name RFCs 1034 and 1035. Internet services that are subject to a high
1762 change frequency legitimately use low TTLs, and even TTLs of zero. Uses of zero-length
1763 TTLs are mentioned in relevant RFCs, including RFC 1035.

1764

1765 Imposing minimum lengths for TTLs is therefore contrary to standard engineering practices,
1766 will interfere with the operation of existing sites and services, may stifle the development of
1767 innovative services, and will impose costs on site operators and their service providers.
1768 Even if such limits were desired, there is presently no practical way that any entity could
1769 impose minimum TTLs on those parties responsible for setting them authoritatively. We do
1770 not know of any technical mechanism by which ICANN could limit the TTLs that zone
1771 administrators decide to install on their own RRsets. Any policy mechanism to limit the TTLs
1772 that zone administrators decide to install on their own RRsets would require volunteer
1773 compliance from all hosting parties world-wide -- which will not be practical or effective.

1774

1775 ***Is it practical or desirable to implement measures that limit the number of nameserver
1776 changes allowed in a given time period, or prevent automated (scripted) changes to
1777 name server configurations? Would authenticating contacts before permitting
1778 changes to NS records be practical or desirable?***

1779

1780 Such a solution would force registrants to change their behaviors and expectations, and
1781 would impose delays and inconveniences upon Web site managers. The current paradigm
1782 allows gTLD registrants to change their records as they see fit, and it would be difficult to roll
1783 this back.

1784

1785 Such a system would also impose additional costs on registrars, which could be passed on
1786 to registrants in the form of higher registration fees.

1787 As noted above, these counter-measures are effective against double-flux networks only,
1788 and the use of double-flux networks should be quantified so as to understand the impact of
1789 the proposed solution and weigh the benefits against the costs.

1790

1791 ***Is limiting the number of name servers that can be defined for a given domain***
1792 ***practical or desirable?***

1793

1794 No. Fast-fluxing domain names usually only have a few nameservers associated with them,
1795 often only four or five. There are legitimate reasons for registrants to use that number of
1796 nameservers, including robustness and redundancy. An example is icann.org, which has five
1797 nameservers listed.

1798

1799 ***Is reporting to law enforcement useful and effective?***

1800

1801 We applaud the dedicated work of law enforcement, and encourage reporting, but it does
1802 not provide a comprehensive or speedy solution. Counter to some popular perception, the
1803 vast majority of Internet crime is not addressed through the efforts of law enforcement, and
1804 is not reported to law enforcement. Domain take-downs are usually accomplished by the
1805 entities affected, working with ISPs, hosting companies, server operators, registrars,
1806 registries, and individual computer owners. Law enforcement bodies are often under-funded,
1807 and often do not have resources to devote to cyber-crime. Jurisdictional issues also hamper
1808 the investigation and prosecution of Internet crimes. Some registries and registrars have
1809 established relationships with law enforcement bodies to provide information related to
1810 nefarious uses of domain names.

1811

1812 **8. What would be the impact (positive or negative) of establishing limitations,**
1813 **guidelines, or restrictions on registrants, registrars and/or registries with respect to**
1814 **practices that enable or facilitate fast flux hosting? What would be the impact of these**
1815 **limitations, guidelines, or restrictions to product and service innovation?**

1816 Also see number 7 above for discussions of the applicability and impact of establishing
1817 limitations, guidelines, or restrictions on those parties.

1818

1819 Some solutions aimed at criminal activity could prohibit or constrain non-criminal activity that
1820 use similar techniques, or might not differentiate adequately based on the intent of the
1821 activity. Other solutions may require parties to separate the criminal uses from the non-
1822 criminal, which is sometimes difficult. Whether solutions to criminal fast-flux may constrain
1823 non-criminal services and/or the creation of new and legitimate services on the Internet are
1824 pertinent issues for consideration. See also #7 above. One case study examined by the
1825 Working Group indicates the possible existence of such a service (UltraReach, which claims
1826 to be an anti-censorship service founded under human rights repression). The Working
1827 Group does not know how many relevant sites or services may already be operating on the
1828 Internet, or what they do, and therefore does not know the impact of some potential
1829 solutions. Absent such knowledge, we think it wise to “do no harm” and avoid limitations,
1830 guidelines, or restrictions that could impact legitimate services.

1831

1832 We also note that fast flux hosting is a phenomenon that utilizes the DNS, and therefore is
1833 technically relevant to all TLDs. Fast flux hosting currently occurs on many domain names
1834 and hosts across a wide range of TLDs. Regulation in the gTLD space only would leave fast
1835 flux activity unaddressed in the ccTLD space. We ask whether there is lasting value to
1836 developing gTLD policy regarding any issue that occurs in both gTLDs and ccTLDs.
1837 Attempts to technically (rather than administratively) cope with fast flux may result in
1838 increasingly complicated solutions that may inadvertently impact innocent parties, and/or
1839 may or break the network in hard-to-diagnose ways.

1840

1841 **9. What are some of the best practices available with regard to protection from fast** 1842 **flux?**

1843

1844 It may be useful to look at fast flux as an example of a generalized problem: domain name
1845 abuse. In many ways, fast-flux hosting is not conceptually any different from other domain
1846 name abuses. Spam, phishing, pharming, and malware also all take advantage of the DNS
1847 and Internet protocols. Efforts to mitigate these problems involve detection of potential
1848 problem domains, determinations of whether the activities on specific domain names may be
1849 illegal or violate terms of service, and then mitigation work. These are many of the exact
1850 same issues faced in the current fight against fast-flux hosting, and best practices for
1851 domain name takedowns could be adapted. In fact, fast-flux domains are already being
1852 mitigated using these existing practices.

1853

1854 Those problems are mitigated on a daily basis by private parties, including ISPs and network
1855 operators, hosting companies, registrars, registries, security companies, law enforcement,
1856 and individuals. This community is free to adapt its tactics and invent new alliances as
1857 needed. We recall that one of ICANN's core values, enshrined in its bylaws, is: "To the
1858 extent feasible and appropriate, delegating coordination functions to or recognizing the
1859 policy role of other responsible entities that reflect the interests of affected parties."

1860 There are cooperative initiatives designed to facilitate data sharing and the identification of
1861 problematic domain names. Examples include the Anti-Phishing Working Group (APWG) for
1862 phishing and identity theft, the Messaging Anti-Abuse Working Group (MAAWG) for spam,
1863 ShadowServer Foundation for botnets, StopBadware.org for malware, and so on. Such
1864 efforts are a possible model for addressing fast-flux hosting.

1865 See also #10 below.

1866

1867 **10. Which areas of fast flux are in scope and out of scope for GNSO policy making?**

1868

1869 The GNSO Issues Report on Fast Flux Hosting noted that a consensus policy resulting from
1870 the GNSO policy-development process would only be applicable if fast flux hosting is an
1871 issue "for which uniform or coordinated resolution is reasonably necessary to facilitate
1872 interoperability, technical reliability, and/or operational stability of Registrar Services,
1873 Registry Services, the DNS, or the Internet." While fast-flux hosting is a recognized problem
1874 that impacts various parties, fast-flux hosting has not materially impacted the interoperability,
1875 technical reliability, and/or operational stability of Registrar Services, Registry Services, the
1876 DNS, or the Internet. Those services continue to function in a stable and reliable manner.

1877

1878 As we have stated before, we believe that ICANN's purview with regard to making policy to
1879 mitigate criminal use of the DNS is very limited. At the core, combating fast-flux hosting is a
1880 matter of identifying and disabling domains that are being used for illegal purposes. It is not
1881 within ICANN's purview to impose requirements that registries act as judge and jury, or to
1882 act on every allegation that may be made about purported illegal uses of domain names. To
1883 do so would turn registries into enforcement agencies. It is not within ICANN's purview to
1884 determine (or license another evaluative body to determine), which domain names are being
1885 used for illegal purposes. To require registries to act against certain domain names may also
1886 expose registries to unknown liabilities, and it is not clear whether ICANN has an effective

1887 ability to protect contracting parties from these liabilities. As per the GNSO Issues Report on
1888 Fast Flux Hosting, "General Counsel further notes that the overall question of how to
1889 mitigate the use of fast flux hosting for cybercrime is broader than the GNSO policy
1890 development process." We agree. How to mitigate or prevent the use of fast-flux hosting for
1891 crime is indeed the central issue.

1892

1893 Efforts within ICANN and the GNSO will yield only incremental results. ICANN policies
1894 related to fast-flux hosting would only be applicable to gTLD registries and registrars. ccTLD
1895 domain names are also used for fast-flux hosting, which comprise almost half of the domain
1896 names on the Internet. Criminals who use fast-flux hosting could simply avoid the effects of
1897 ICANN policy by using ccTLD domain names. Therefore, we are unsure of the "lasting
1898 value" to developing gTLD policy regarding this issue. ICANN policies that target fast-flux
1899 hosting would only be applicable to gTLD registries and could impact their costs, and
1900 therefore affect their competitiveness with ccTLDs.

1901

1902 The GNSO Issues Report on Fast Flux Hosting stated that "The question of whether policy
1903 options would have 'lasting value or applicability' is a particularly important consideration in
1904 the context of fast flux hosting, where new static rules imposed through a policy
1905 development process might be quickly undermined by intrepid cybercriminals." There are
1906 venues for dealing with criminal activity, and ICANN is not such a venue. ICANN is not
1907 suited to creating or overseeing detailed policies and procedures in such a rapidly evolving
1908 environment as cybercrime, where the criminals and responders are continually employing
1909 new measures and counter-measures. Instead, it may be more helpful to let private actors
1910 have the freedom and power to act within relevant legal and contractual contexts.

1911 Spam, phishing, pharming, and malware are threats at least as prominent as fast-flux
1912 hosting, and arguably cause more damage and problems. Those abuses also leverage the
1913 DNS, have not entailed policy-making at the ICANN level, and have not demanded uniform
1914 or coordinated resolution. We therefore question why fast-flux hosting is a suitable topic for
1915 an ICANN process.

1916

1917

1918 In many ways, fast-flux hosting is not conceptually any different from other domain name
1919 abuses. Spam, phishing, pharming, and malware also all take advantage of the DNS and
1920 Internet protocols. Those problems are mitigated on a daily basis by private parties,

1921 including ISPs and network operators, hosting companies, registrars, registries, security
1922 companies, and individuals. (Counter to some popular perception, the vast majority of
1923 abusive domain names are not taken down by the efforts of law enforcement.) These
1924 mitigation efforts often involve detection of potential problem sites, determinations of
1925 whether the activities on specific domain names are illegal or not, and then mitigation efforts.
1926 These are many of the exact same issues faced in the fight against fast-flux hosting. One of
1927 ICANN's core values, enshrined in its bylaws, is: "To the extent feasible and appropriate,
1928 delegating coordination functions to or recognizing the policy role of other responsible
1929 entities that reflect the interests of affected parties."

1930

1931

1932

1932

IPC Initial Reaction

1933

1934 "The IPC appreciates very much the activity of the Fast Flux WG. We recognize that Fast
1935 Flux is a serious topic which so far has not been widely discussed and analysed. The work
1936 of the Fast Flux WG enables members of the IPC to learn more about the issues involved.
1937 At the moment IPC does not have any specific comments or recommendations regarding
1938 Fast Flux and the most appropriate resolution of negative impacts connected with Fast Flux,
1939 nevertheless we hope to be able to comment in detail at a later stage of the work of the
1940 WG."

1941 **Non-Commercial Users Constituency Statement on**
1942 **Fast Flux Hosting**

1943

1944 The NCUC formally collects constituent input via its email discussion list as well as
1945 through a variety of informal communications.

1946

1947 **Definitions**

1948

1949 The working group has struggled considerably to define the term “fast flux,” largely
1950 because the term already has a preexisting meaning within the computer security
1951 community. Discussions have, however, made clear that the group needs terms in order to
1952 have productive discussion on this issue. Specifically, the group must be able to distinguish
1953 between those technical measures which it may be possible to effectively identify and
1954 regulate and the more difficult to measure elements such as intent and legality.

1955

1956 Additionally, the working group ought to have some terms to distinguish between
1957 those malevolent uses that are universally reviled and other uses, which might be effected
1958 by remedial measures. Legality has proven to be an inadequate benchmark, since the
1959 Internet is by nature global, and ICANN should not take it upon itself to resolve international
1960 conflicts of laws. Moreover, determinations of legality often turn on elements such as intent,
1961 which the DNS community is ill-disposed to assess.

1962

1963 Because of the inherent need for these distinctions, and because of the baggage
1964 associated with the terms “fast flux” and “fast flux hosting” it would be best to craft new terms
1965 to describe these concepts. As far as semantics are concerned, the working group's task is
1966 not to find the meaning of the terms we have been using but rather to find terms that will
1967 facilitate a meaningful discussion.

1968

1969 **Benefits and Harms**

1970

1971 The techniques of using domains with a short time to live or using a large network of
1972 computers to host content at a single domain are not inherently moral, immoral, beneficial or
1973 harmful. These qualities come not from the technologies themselves, but from the ways in

1974 which they are used. ICANN should be particularly wary of any attempt to ban a technology
1975 because of one use associated with it.

1976

1977 Insofar as fast flux can be used by criminals to evade authorities or to make a
1978 website appear more trustworthy than it is, it contributes to these harms. It would, however,
1979 be a mistake to equate the nefarious activities with the technology. Even if fast flux were
1980 completely eliminated these activities would still persist on-line.

1981

1982 Moreover, this technology (FFH) has demonstrated significant legitimate uses. Fast
1983 flux has been shown to be helpful in combating a denial of service attack and also with
1984 facilitating anonymous speech. Both current and future uses may be significantly impaired
1985 by attempts to ban the use of this technology. Unfortunately, it is difficult to assess how
1986 these uses may be impacted by ICANN measures, both because of the inherent difficulty in
1987 anticipating new technology and because of the difficulties of trying to communicate with
1988 speakers who may be currently using similar techniques to speak anonymously.

1989

1990 ICANN should take particular care to protect anonymous speech. Anonymous
1991 speech allows free expression by parties who might otherwise be subject to scorn or
1992 retribution for expressing unpopular opinions. This right to express one's true opinions
1993 without fear of reprisal is fundamental to the shared ideals of free speech, privacy, and basic
1994 human dignity. These rights are recognized and protected by the First Amendment to the
1995 U.S. Constitution and Article 12 of the Universal Declaration of Human Rights. Even where
1996 the strongest legal protections for free speech exist, the right to speak anonymously is still
1997 needed to protect against attacks by individuals, ensure open and honest discourse, and to
1998 allow speakers to contribute ideas without sacrificing privacy. For this reason, the U.S.
1999 Supreme court has explicitly ruled that the U.S. Constitution protects an individual's right to
2000 speak anonymously. ICANN should not take it upon itself to usurp this governmental
2001 function and second guess which human rights should be guaranteed to individuals and
2002 which should be terminated.

2003

2004

2005 **Potential Remedies**

2006

2007 Any attempt to remedy the harms that accompany fast flux hosting should be
2008 evaluated with due consideration to the limits of what ICANN can and should do. ICANN
2009 must be vigilant to recognize the limited scope of its authority and mandate. ICANN is not a
2010 police force, government regulator or court of law. It is ill suited to determine which
2011 countries' laws should control on-line activity, determine when those laws have been
2012 breached, or create new rules intended to combat social ills.

2013

2014 There are significant dangers inherent in making any private entity, including ICANN,
2015 responsible for determining when anonymous speech is or is not permissible. Democratic
2016 societies have constitutions, elections, and courts to carefully balance the rights of the
2017 speaker against the rights of others. Private entities do not have the same incentives and
2018 legal compulsions to protect the rights of individuals. Because of this, private censorship is
2019 the single greatest threat to free speech on the Internet.

2020

2021 Many plaintiffs have already considered registrars and ISPs as potential private
2022 censors. They have filed suit against these entities because they objected to certain speech
2023 on-line. AOL, Network Solutions, and Dynadot are among those targeted by such suits.
2024 Sometimes these plaintiffs seek to have the content removed or rendered harder to access.
2025 Sometimes they are merely seeking a defendant with deep pockets. In all cases, however,
2026 the plaintiffs assert that Internet companies should censor the content of their customers.

2027

2028 Because of these problems, ICANN should be extremely wary of proposed solutions
2029 that discourage anonymous communications on the presumption that such communications
2030 are inherently malevolent. Informational approaches are preferable to those which prevent
2031 anonymous speech, and precautions should be included in any solution to ensure that we
2032 are not creating a precedent of censorship within the DNS community.

2033

2033 **Fast-Flux PDP Working Group**

2034

2035 **Input from Registrar Constituency Members**

2036

2037 **Summary**

2038

2039 *We acknowledge that some perpetrators of online criminal acts employ the fast-flux*
2040 *technique, and that these illicit activities can cause harm to a variety of parties including*
2041 *registrars and their customers. Nevertheless, the use of fast-flux is not indicative that a*
2042 *domain or registrant is engaged in some illicit behavior. Even when objectionable activity*
2043 *does occur, it may be beyond ICANN's limited technical mandate to address it. We do not*
2044 *believe that the Fast-Flux PDP Working Group has an adequately formed sense of the issue*
2045 *to proceed with the policy development process at this time. We do believe that further*
2046 *quantification and analysis of the issue is warranted and would aid in its definition. Only then*
2047 *should any ICANN-chartered working group begin discussions of voluntary best practices*
2048 *that would facilitate data sharing and are designed to identify problematic domain names.*
2049 *This input is being provided by the undersigned members of the Registrar Constituency who*
2050 *are serving on the Fast-Flux Working Group. There is no official input statement from the*
2051 *Registrar Constituency at this time.*

2052

2053 **Overview and Response to Questions**

2054

2055 It is evident from its voluminous email archive that the Fast-Flux PDP Working Group has
2056 struggled to adequately define the issue. The lack of a clear understanding of the scope and
2057 ramifications of fast-flux hosting also has undermined discussion of potential courses of
2058 action to address illicit activities. Significantly, there is disagreement about whether this
2059 issue even falls within the scope of the GNSO Policy Development Process and ICANN's
2060 limited technical mandate. For all of these reasons, we believe that this issue needs to be
2061 reconsidered from the start. We will highlight our specific concerns as we address the key
2062 questions that were put to the Working Group in its charter.

2063

2064 **1. Who benefits from, fast flux, and who is harmed?**

2065

2066 The Working Group determined that individuals and groups that are attempting to avoid or
2067 evade detection, identification, and takedown may use fast-flux hosting. These users could
2068 include spammers, fraud agents, distributors of illegal products or materials, and other “bad
2069 actors.” Alternatively, they may comprise political dissidents and other free speech
2070 advocates use fast-flux hosting to avoid suppression or censorship. Furthermore, some
2071 website administrators use fast-flux as a tool to optimize network performance and reliability.
2072 It also can be used to perform maintenance or route diagnosis on domains under
2073 management.

2074

2075 At this time the only thing that we can reasonably conclude is that fast-flux hosting
2076 “benefactors” and “victims” defy a simple definition. Much of this is the result of the
2077 Working Group not having adequate data to inform its discussion. Most of the
2078 provided examples were anecdotal, and lacked the necessary specificity to formulate
2079 a comprehensive description. It is not clear when (or even if) a more substantial base
2080 of data will be available. We believe that collection and analysis of fast flux-related
2081 data is essential. We also believe that this GNSO-constituted Working Group is not
2082 necessarily the most appropriate body to conduct the research. Perhaps the SSAC
2083 should be charged with developing the necessary data in consultation with industry
2084 experts, academic researchers, and other industry groups such as the APWG. Since
2085 this issue extends beyond the GNSO’s constituency groups, future policy
2086 development should include the ccNSO and law enforcement representatives.

2087

2088 2. Who would benefit from cessation of the practice and who would be harmed?

2089

2090 The Working Group hypothesized that the entire community might benefit – but only under
2091 the assumption that illicit activities alone will be impeded by eliminating fast flux. It was
2092 generally agreed that criminal elements would quickly adapt their tactics, and any policy-
2093 induced gains would be temporary. Security companies also might benefit, but this assumes
2094 that Registrars and Registries become de facto data collection and enforcement agencies.
2095 This raises liability concerns and significant questions about scope, however. If we assume
2096 that ICANN can prohibit any use of the fast flux technique, then free speech advocates and
2097 network administrators who use it for their own ends clearly would be harmed.

2098

2099 We are discouraged that the Working Group’s charter includes such a loaded

2100 question. It implies that all fast flux activity is negative and does not consider
2101 legitimate uses of the technique. More importantly, we have not seen any data
2102 demonstrating that fast-flux hosting has materially impacted the inter-operability,
2103 technical reliability and/or operational stability of Registrar Services, Registry
2104 Services, the DNS, or the Internet. If cannot demonstrate or effectively quantify harm
2105 within the scope of ICANN's mandate, how can we reliably identify benefactors or
2106 victims?

2107

2108 3. Are registry operators involved, or could they be, in fast flux hosting activities? If so, how?

2109

2110 4. Are registrars involved in fast flux hosting activities? If so, how?

2111

2112 5. How are registrants affected by fast flux hosting?

2113

2114 6. How are Internet users affected by fast flux hosting?

2115

2116 No gTLD Registry Operator was cited in the Working Group's deliberations. There were
2117 suggestions that sophisticated criminal networks may create or control an ICANN-accredited
2118 registrar to facilitate illicit activities using fast-flux hosting, but no data has been provided to
2119 support this claim. Besides being victimized by the illicit scams facilitated by fast-flux hosting
2120 (spam, identity theft, phishing, fake pharmaceuticals, etc.), registrants could be affected if
2121 registrars' transaction streams are swamped by fast-flux traffic. Unless they are directly
2122 victimized by a fluxing online scam, fast-flux hosted domains probably won't be visible to
2123 Internet users.

2124

2125 Again, we are discouraged that the Working Group's charter questions include loaded terms.
2126 Also, no data has been offered to corroborate claims that some Registrars are "involved" in
2127 fast-flux hosting activities. Care should be taken to distinguish between fast-flux as a
2128 facilitating technique and the illicit activities themselves. In many cases it is beyond ICANN's
2129 narrow technical mandate to try to address issues that are considered criminal in certain
2130 local jurisdictions.

2131

2132 7. What technical, e.g. changes to the way in which DNS updates operate, and policy, e.g.
2133 changes to registry/registrar agreements or rules governing permissible registrant behavior

2134 measures could be implemented by registries and registrars to mitigate the negative effects
2135 of fast flux?

2136

2137 8. What would be the impact (positive or negative) of establishing limitations, guidelines, or
2138 restrictions on registrants, registrars and/or registries with respect to practices that enable or
2139 facilitate fast flux hosting? What would be the impact of these limitations, guidelines, or
2140 restrictions to product and service innovation?

2141

2142 Different measures have been suggested to reduce or eliminate fast-flux activities, including:

2143

2144 • limiting the frequency of nameserver and/or A record add/edit/delete transactions;
2145 and/or

2146

2147 • limiting the time-to-live (TTL) minimum value that would be accepted by registry
2148 operators; and/or

2149

2150 • whitelisting legitimate fast-flux activities; and/or

2151

2152 • Restricting or limiting foreign nameservers, i.e. those that are controlled by a different
2153 TLD (especially ccTLDs) than the domain to which they are associated.

2154

2155 The Working Group also discussed the need to provide some liability protection for
2156 Registrars in addressing false positive cases generated by programmatic fast-flux
2157 identification systems.

2158

2159 Many registrars (as well as other Working Group participants) feel that these
2160 questions are outside the scope of this working group. In fact, both the ICANN staff
2161 and General Counsel recommended gathering more information before initiating the
2162 PDP since a number of the questions appeared to be out of scope. We concur with
2163 the Registry Constituency's statement that "[w]e do not think that making policy to
2164 mitigate criminal use of fast-flux hosting is reasonably and appropriately related to
2165 ICANN's technical functions. At the core, combating fast-flux hosting is a matter of
2166 identifying and disabling domains that are being used for illegal purposes."

2167

2168 We also agree with the Registry Constituency's position that it is not within ICANN's
2169 purview to place registrars or registries in a position to become extensions of law
2170 enforcement regimes around the world, nor to act on every allegation about illegal
2171 uses of domain names. ICANN is not in a position to distinguish between legitimate
2172 domain names and those used for illegal purposes solely on the basis of fast-flux
2173 detection.
2174

2175 9. What are some of the best practices available with regard to protection from fast flux?
2176

2177 Until such time that we have the necessary data and analysis to establish the scope
2178 of the problem, we feel that it is premature to ask any ICANN-chartered working
2179 group to begin discussions of voluntary best practices that would facilitate data
2180 sharing and are designed to identify problematic domain names.
2181

2182 10. Which areas of fast flux are in scope and out of scope for GNSO policy making.
2183

2184 This question is best addressed by ICANN's General Counsel. We have also noted
2185 our concerns about questions of scope above.
2186

2187 Respectfully submitted,
